Abstract

Higher-order abstract syntax is a simple technique for implementing languages with functional programming. Object variables and binders are implemented by variables and binders in the host language. By using this technique, one can avoid implementing common and tricky routines dealing with variables, such as capture-avoiding substitution. However, despite the advantages this technique provides, it is not commonly used because it is difficult to write sound elimination forms (such as folds or catamorphisms) for higher-order abstract syntax. To fold over such a datatype, one must either simultaneously define an inverse operation (which may not exist) or show that all functions embedded in the datatype are In this paper, we show how first-class polymorphism can be used to guarantee the parametricity of functions embedded in higher-order abstract syntax. With this restriction, we implement a library of iteration operators over data-structures containing functionals. From this implementation, we derive "fusion laws" that functional programmers may use to reason about the iteration operator. Finally, we show how this use of parametric polymorphism corresponds to the Schürmann, Despeyroux and Pfenning method of enforcing parametricity through modal types. We do so by using this library to give a sound and complete encoding of their calculus into System F_{ω} . This encoding can serve as a starting point for reasoning about higher-order structures in polymorphic languages.

Introduction

Higher-order abstract syntax (HOAS) is an old and seductively simple technique for implementing a language with functional programming.¹ The main idea is elegant: instead of representing object variables explicitly, we use metalanguage variables. For example, we might represent the object calculus term $(\lambda x.x)$ with the Haskell expression $lam (x \rightarrow x)$. Doing so eliminates the need to implement a number of tricky routines cation in the metalanguage. However, outside of a few specialized domains, such as theorem proving, partial evaluation [26], logical frameworks [22] and intensional type analysis [27, 30], higher-order abstract syntax dealing with object language variables. For example, capture-avoiding substitution is merely function applihas found limited use as an implementation technique.

One obstacle preventing the widespread use of this technique is the difficulty in using elimination forms, such as catamorphisms², for datatypes containing functions. The general form of catamorphism for these datatypes requires that an inverse be simultaneously defined for every iteration [16]. Unfortunately, many

operations that we would like to define with catamorphisms require inverses that do not exist or are expensive

However, if we know that the embedded functions in a datatype are parametric, we can use a version argument; it may only use it abstractly or "push it around". Only allowing parametric embedded functions works well with HOAS because the terms with non-parametric embedded functions are exactly those that have no correspondence to any λ -calculus term [24]. In this paper, we use iterator to refer to a catamorphism of the catamorphism that does not require an inverse [9, 24]. A parametric function may not examine its restricted to arguments with parametric functions.

Sheard [9] add tags to mark the types of datatypes whose embedded functions are not parametric, prohibiting A type system can separate parametric functions from those that are not. For example, Fegaras and

While the name comes from Pfenning and Elliott [21], the idea itself goes back to Church. [4].

²Catamorphisms (also called folds) are sometimes represented with the bananas $(|\cdot|)$ notation [15].

modality ("box") to mark those terms that allow iteration.

iteration over those datatypes. Alternatively, Schürmann, Despeyroux and Pfenning [24, 8] use the necessity

scription of how restricting datatypes to parametric function spaces can be enforced in the Haskell language using first-class polymorphism. We provide a safe and easy implementation of a library for iteration over higher-order abstract syntax. This Haskell library allows the natural expression of many algorithms over the However, many modern typed languages already have a mechanism to enforce that an argument be used abstractly—parametric polymorphism. It seems desirable to find a way to use this mechanism instead of adding a separate facility to the type system. In this paper, we show how to encode datatypes with Our specific contributions are the following. For functional programmers, we provide an informal deobject language; to illustrate its use, we use it to implement a number of operations including Danvy and Filinski's optimizing one-pass CPS conversion algorithm [6]. Furthermore, because we encode the iteration parametric function spaces in the polymorphic λ -calculus, including iteration operators over them.

functional programmers may use to reason about their programs.

operator within the polymorphic λ -calculus, we also derive "fusion laws" about the iteration operator that

To show the generality of this technique, we use this implementation to show a formal translation from

parametric function spaces. It demonstrates how systems based on the polymorphic λ -calculus may be We do not claim that this encoding will solve all of the problems with programming using higher-order abstract syntax. In particular, algorithms that require the explicit manipulation of the names of bound the Schürmann, Despeyroux and Pfenning modal calculus [24] (called here the SDP calculus) to System F_{ω} . This encoding has an added benefit to language designers who wish to incorporate reasoning about extended with reasoning about higher-order structure.

The remainder of this paper is as follows. Section 2 starts with background material on catamorphisms variables remain outside the scope of this implementation technique.

for HOAS, including those developed by Meijer and Hutton [16] and Fegaras and Sheard [9]. In Section 2.1 we show how to use first-class polymorphism and abstract types to provide an interface for Fegaras and Sheard's implementation that enforces the parametricity of embedded functions. Using this interface, we show some examples of iteration including CPS conversion (Section 2.2). In Section 3, we describe an implementation of that interface within the part of Haskell that corresponds to System F_{ω} , and describe properties of that implementation in Section 3.1. Section 4 describes the SDP calculus and Section 5 presents an encoding of that calculus into F_{ω} , using the implementation that we developed in Section 3. Section 6 presents future work, Section 7 presents related work, and Section 8 concludes. We include Generic Haskell code for the polytypic part of our implementation in Appendix A and the full encoding of the SDP calculus into System F_{ω} in Appendix B.

Catamorphisms for datatypes with embedded functions

The following recursive datatype represents the untyped λ -calculus using Higher-Order Abstract Syntax

³All of the following examples are in the syntax of the Haskell language [19]. While some of the later examples require an extension of the Haskell type system—first-class polymorphism—this extension is supported by the Haskell implementations

2

data $\text{Exp} = \text{Lam} (\text{Exp} \rightarrow \text{Exp}) \mid \text{App Exp Exp}$

The data constructor Lam represents λ-expressions. However, instead of explicitly representing bound λ-calculus variables, Haskell functions are used to implement binding and Haskell variables are used to represent variables. For example, we might represent the identity function $(\lambda x.x)$ as Lam $(\mathbf{x} \to \mathbf{x})$ or the infinite loop $(\lambda x.(xx))(\lambda x.(xx))$ as App (Lam (\x -> App x x)) (Lam (\x -> App x x)).

Using this datatype, we can implement an interpreter for the λ -calculus. To do so, we must also represent the result values (also using HOAS).

data Value = Fn (Value -> Value)

It is tricky to define recursive operations, such as evaluation, over this implementation of expressions. The argument, x, to Lam below is a function of type $Exp \rightarrow Exp$. To evaluate it, we must convert x to a function of type Value -> Value. Therefore, we must also simultaneously define an inverse to evaluation, called uneval, such that eval . uneval = $x \rightarrow x$. This inverse is used to convert the argument of x from a

```
= Fn (eval . x . uneval)
                                                         eval (App y z) = unFn (eval y) (eval z)
                                                                                                                              uneval (Fn x) = Lam (uneval . x . eval)
                                                                                                uneval :: Value -> Exp
eval :: Exp -> Value
```

Consider the evaluation of $((\lambda x.x)(\lambda y.y))$. First eval replaces App with unFn and pushes evaluation down to the two subcomponents of the application. Next, each Lam is replaced by Fn, and the argument is composed with eval and uneval. The unFn cancels the first Fn, and the identity functions can be removed from the compositions. As uneval is right inverse to eval, we can replace each (eval . uneval) with the identity function.

```
eval (App (Lam (\x -> x)) (Lam (\y -> y)))
                       = unFn _(eval (Lam (\x -> x)))
(eval (Lam (\y -> y)))
= unFn (Fn (eval . \x -> x . uneval))
(Fn (eval . \y -> y . uneval))
```

= (eval . uneval) (Fn (eval . uneval))

= ((x -> x) (Fn ((y -> y))) $= \operatorname{Fn} (\setminus y -> y)$ Many functions defined over Exp will follow this same pattern of recursion, requiring an inverse for Lam

and calling themselves recursively for the subcomponents of App. Catamorphisms capture the general pattern of recursion for functions defined over recursive datatypes. For example, foldr is a catamorphism for the list datatype and can implement many list operations. For lists of type [a], foldr replaces [] with a base case of type b and (:) with a function of type $(a \rightarrow b \rightarrow b)$.

Meijer and Hutton [16] showed how to define catamorphisms for datatypes with embedded functions, such

as Exp. The catamorphism for Exp systematically replaces Lam with a function of type ((a -> a) -> a) and App with a function of type (a -> a -> a). However, just as we defined eval simultaneously with uneval, the catamorphism for Exp must be simultaneously defined with an anamorphism. The catamorphism provides a way to consume members of type Exp and the anamorphism provides a way to generate them

In order to easily specify this anamorphism, we use a slightly more complicated version of the Exp

datatype, shown at the top of Figure 1. This version makes the recursion in the datatype explicit. The newtype Rec computes the fixed point of type constructors (functions from types to types). The type Exp is the fixed point of the type constructor ExpF, where the recursive occurrences of Exp have been replaced with the type parameter a. The first argument to cata is of type Expf a -> a (combining the two functions

newtype Rec a = Roll (a (Rec a))

```
(ExpF a -> a) -> (a -> ExpF a) -> Rec ExpF -> a
                                                                                                                                                                                                                                                                                                                                 App y z \rightarrow App (f y) (f z),
                                                                                                                                                                                                                                                                                                                                                                                          Lam x -> Lam (g . x . f)
App y z -> App (g y) (g z))
                                                                                                                                                                                                                                                                                                         Lam x -> Lam (f . x . g)
                                                                                                                                                                                                                                                   -> (ExpF a -> ExpF b, ExpF b -> ExpF a)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              f ((fst (xmapExpF (cata f g, ana f g))) x)
data ExpF a = Lam (a -> a) | App a a
                                                                                                                                                                                                                                                                                                                                                              /x -> case x of
                                                                                                                                                                                                                                                                             xmapExpF (f,g) = (\x -> case x of
                                                                         :: (Exp -> Exp) -> Exp
                                                                                                                                                 :: Exp -> Exp -> Exp
                                                                                                                                                                                                                             xmapExpF :: (a -> b, b -> a)
                                                                                                                                                                             = Roll (App x y)
                                                                                                    = Roll (Lam x)
                          type Exp = Rec ExpF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cata f g (Roll x) =
                                                                                                                                                                                арр х у
                                                                                                      lam x
                                                                            lam
                                                                                                                                                        app
```

```
(ExpF a -> a) -> (a -> ExpF a) -> a -> Rec ExpF
                                                                                                Roll (snd (xmapExpF (cata f g, ana f g)) (g x))
```

Figure 1: Meijer/Hutton catamorphism

mentioned above, of type $((a \rightarrow a) \rightarrow a)$ and $(a \rightarrow a \rightarrow a)$. The first argument to ana has the inverse type a -> ExpF a.

of type $a \rightarrow b$ and the other of type $b \rightarrow a$. The definition of xmapExpF is completely determined by the definition of ExpF. With Generic Haskell [5], we can define xmap and automatically generate xmapExpF from ExpF (see Appendix A).⁴ That way, we can easily generalize this catamorphism to other datatypes. Unlike map, which is defined only for covariant type constructors, xmap is defined for type constructors that have both positive and negative occurrences of the bound variable. The only type constructors of F_{ω} for which xmap The functions cata and ana are defined in terms of xmapExpF, a generalized version of a mapping function for the type constructor ExpF. Because of the function argument to Lam, xmapExpF maps two functions, one is not defined are those whose bodies contain first-class polymorphism. For example, $\lambda \alpha : \star \cdot \forall \beta : \star \cdot \alpha \to \beta$.

We can use cata to implement eval. To do so we must describe one step of turning an expression into a value (the function evalAux) and one step of turning a value into an expression (the function unevalAux).

```
evalAux :: ExpF Value -> Value
evalAux (Lam f) = Fn f
evalAux (App x y) = (unFn x) y
```

needed, they swap the arguments. This is valid because fst (xmap (f,g)) = snd(xmap (g,f)). However, while the version ⁴Meijer and Hutton's version of xmapExpF only created the first component of the pair. In ana where the second component that we use here is a little more complicated, it can be defined with Generic Haskell.

```
Lam x \rightarrow Lam (g · x · f)
App y z \rightarrow App (g y) (g z))
                                                                                                                                                                                                                                                                                                                                                      App y z \rightarrow App (f y) (f z),
                                                                                                                                                                                                                                                                                                                              Lam x -> Lam (f . x . g)
                                                                                                                                                                                                                                                      data Rec a b = Roll (a (Rec a b)) | Place b
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        f ((fst (xmapExpF (cata f, Place))) x)
                                                                                                                :: (Exp a -> Exp a) -> Exp a
                                            data ExpF a = Lam (a -> a) | App a a
                                                                                                                                                                                      :: Exp a -> Exp a -> Exp a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cata :: (ExpF a -> a) -> Exp a -> a
                                                                                                                                                                                                                                                                                                                                                                              /x -> case x of
                                                                                                                                                                                                          = Roll (App x y)
                                                                                                                                        = Roll (Lam x)
                                                                    type Exp \ a = Rec \ ExpF \ a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cata f (Place x) = x
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cata f (Roll x) =
                                                                                                                                                                                                                app x y
                                                                                                                                          lam x
```

lam

app

Figure 2: Fegaras/Sheard catamorphism

unevalAux :: Value -> ExpF Value

unevalAux (Fn f) = Lam f

eval :: Exp -> Value eval x = cata evalAux unevalAux x

specified. None of eval, evalaux or unevalaux are recursively defined. However, for some operations, there is no obvious (or efficient) inverse. For example, to using cata to print out expressions also requires writing f what it has just done with g. This situation occurs when the argument to cata contains only parametric Using cata to implement operations such as eval is convenient because the pattern of recursion is already a parser. Fegaras and Sheard [9] noted that sometimes the operation of the catamorphism often undoes with functions. A parametric function is one that does not analyze its argument with case or cata.

ana. The basic idea is that for parametric functions, any use of ana during the computation of a catamorphism they use a place holder to store the original argument. When cata reaches that place holder, it returns the When the argument to cata is parametric, Fegaras and Sheard showed how to implement cata without will always be annihilated by cata in the final result. Therefore, instead of computing the anamorphism, stored argument.

To implement Fegaras and Sheard's catamorphism, we must redefine Rec. In Figure 2, we extend it with an extra branch (called Place) that is the place holder. Because Place can contain any type of value, Rec (and consequently Exp) must be parameterized with the type of the argument to Place. This type is the result of the catamorphism over the expression. In the implementation of cata, Place is the second argument to xmapExpF instead of ana f. It is a right inverse to cata f by definition.

For example, to count the number of occurrences of bound variables in an expression, we might use the

countvarAux :: ExpF Int -> Int
countvarAux (App x y) = x + y
countvarAux (Lam f) = f 1

countvar :: Exp Int -> Int
countvar = cata countvarAux

The function countvarAux describes what to do in one step. The number of variables in an application expression is the sum of the number of variables in x and the number of variables in y. In the case of a λ -expression, f is a function from the number of variables in a variable expression (i.e. one) to the number of variables in the body of the lam. For example, to count the variables in $(\lambda x. x. x)$:

```
countvar (lam (\x -> app x x))
```

```
= (countvar (Place 1)) + (countvar (Place 1))
  . Place) 1
                                                          + (countvar (Place x))) 1
                          = (\x -> (countvar (Place x))
= (countvar . (x \rightarrow x + x)
```

This definition of cata only works for arguments whose function spaces are parametric and who do not use Place. Informally, we call such expressions sound and other expressions unsound. Applying cata to an unsound expression can return a meaningless result. For example, say we define the following term:

```
badplace :: Exp Int
```

badplace = lam ($\xspace x - \space 3$)

Then countvar badplace = 3, even though it contains no bound variables. Even more importantly for higher-order abstract syntax, unsound datatypes do not correspond to untyped λ -calculus expressions, so it is important to be able to distinguish between sound and unsound representations. 5

There are two ways for parametricity to fail, corresponding to the two destructors for the type Exp a. A

function is not parametric if it uses cata or case to examine its argument, as below:

```
badcata = lam (\xspace x => 1)
                                                then app x
badcata :: Exp Int
```

badcase = lam (\x -> case x of badcase :: Exp a

```
Roll (App v w) -> app x x
Roll (Lam f) -> x
Place v -> x)
```

Fegaras and Sheard designed a type system to distinguish between sound and unsound expressions. Datatypes such as Exp were annotated with flags to indicate whether they had been examined with either case or cata, and if so, they were prevented from appearing inside of non-flagged datatypes. Furthermore, their language prevented the user from accessing Place by automatically generating cata from the definition of the user's datatype. ⁵It is also important to distinguish between sound and unsound members of datatypes that have meaningful non-parametric representations. For these datatypes, the behavior of the Fegaras and Sheard catamorphism on unsound arguments does not correspond to the Meijer and Hutton version.

_

```
type Rec a b -- abstract
data ExpF a = Lam (a -> a) | App a a
type Exp a = Rec ExpF a
```

roll :: ExpF (Exp a) -> Exp a place :: a -> Exp a cata :: (ExpF a -> a) -> Exp a -> a

Figure 3: Iteration library interface

2.1 Enforcing parametricity with type abstraction

The type of badcata is Exp Int. This type tells us that something is wrong: the type parameter of Exp is constrained to be Int, so we can only use cata on this expression to produce an Int. The same is true for to enforce that the argument to a function is sound. That way, we can be assured that it will behave as below. The implementation of cata uses the argument at the specific type (Exp a), so it is safe for itero badplace. Whenever we use cata or Place in an expression, this parameter will be constrained. If we can ensure that only sound expressions have type (forall a. Exp a), then we can use first-class polymorphism expected. For example, define a version of cata, called iter0 that may only be applied to sound expressions, to require that its argument has the more general type (forall a. Exp a).

```
iter0 :: (ExpF b -> b) -> (forall a. Exp a) -> b
```

We can prevent such case analysis inside lam expressions by ruling out case analysis for all terms of type Exp t. If the user cannot use case, then they cannot write badcase. While this restriction means that some operations cannot be naturally defined in this calculus, cata alone can define a large number of operations, However, this new type does not prevent expressions like badcase from being the argument to iter0. as we demonstrate below and in Section 2.2. There are two ways to prohibit case analysis. The first way is to reimplement Exp in such a way that cata is the only possible operation (in other words without using a Haskell datatype). We discuss this alternative

of Rec is hidden by some module boundary, such as with the interface in Figure 3, then the only way to destruct an expression of type Exp a is with cata. Because Roll and Place are datatype constructors of However, because we only need to prohibit case analysis, we can export Roll and Place as the functions The second way to prohibit case analysis is to make Rec an abstract type constructor. If the definition Rec, and cata pattern matches these constructors, they must all be defined in the same module as Rec. roll and place. With roll we can define the terms app and lam anywhere.

We can also make good use of place. The type forall a. Exp a enforces that all embedded functions are parametric, but it can only represent closed expressions. What if we would like to examine expressions with free variables? In HOAS, an expression with one free variable has type Exp t -> Exp t. To compute the catamorphism for the expression, we use place to provide the value for the free variable

```
openiter1 f x = y - cata f (x (place y))
-> (Exp b -> Exp b) -> (b -> b)
```

If we would like to make sure that the expression is sound, we must quantify over the parameter type and require that the expression have type forall a. Exp a \rightarrow Exp a.

```
-> (forall a. Exp a -> Exp a) -> (b -> b)
iter1 :: (ExpF b -> b)
                                                             iter1 = openiter1
```

With iter1 we can determine if that one free variable occurs in an expression.

freevarused :: (forall a. Exp a -> Exp a) -> Bool

iter1 (\x -> case x of freevarused e =

An app expression uses the free variable if either the function or the argument uses it. The occurrence of $(App x y) \rightarrow x | | y$ (Lam f) \rightarrow f False) e True

the bound variable of a lam is not an occurrence of the free variable, so False is the argument to f, but the expression does use the free variable if it appears somewhere in the body of the abstraction. Finally, the program works by feeding in True for the value of the free variable. If the result is True then it must have appeared somewhere in the expression.

There is no reason to stop with one free variable. There are an infinite number of related iteration operators, each indexed by the type inside the forall. The types of several such iterators are shown below. For example, the third one, iterList, may analyze expressions with arbitrary numbers of free variables.

:: (ExpF b -> b)

(q <- q <- q) <-

```
-> ((b -> b) -> b)
iterList :: (ExpF b -> b)
-> (forall a. ([Exp a] -> Exp a))
-> ([b] -> b)
```

be able to automatically generate all of these iterators using Generic Haskell. The following code implements Each of these iterators is defined by using xmap to map (cata f) and place. Thus we can easily implement them by defining the appropriate version of xmap. However, because xmap is a polytypic function, we should these operations. Below, the notation xmap{|g|} generates the instance of xmap for the type constructor g.

```
openiter{|g :: * -> * |} ::
    (ExpF a -> a) -> g (Exp a) -> g a
openiter{|g|} f =
    fst (xmap{|g|} (cata f, place))
```

```
iter{|g :: * -> * |} ::
    (ExpF a -> a) -> (forall b. g (Exp b)) -> g a
iter{|g|} = openiter{|g|}
```

Unfortunately, the above Generic Haskell code cannot automatically generate all the iterators that we want, such as iter1, iterFun and iterList. Because of type inference, g can only be a type constructor that is a constant or a constant applied to type constructors [13]. In particular, we cannot represent the type constructor $(\lambda \alpha : \star ..\alpha \to \alpha)$ in Haskell, so we cannot automatically generate the instance

```
iter1 :: (f b -> b)
-> (forall a. (Exp a) -> (Exp a)) -> b -> b
```

Fortunately, using a different extension of Haskell, called functional dependencies [14], we can generate these versions of openiter. For each version of iter that we want, we still need to redefine the generated openiter with the more restrictive type.

```
-> (forall b. Exp b -> Exp b) -> a -> a
iter1 :: (ExpF a -> a)
```

The Iterable class defines openiter simultaneously with its inverse. The parameters m and n should be $g(\mathbf{Exp} \ \mathbf{a})$ and $g\ \mathbf{a}$, where each instance specifies g. (The type \mathbf{a} is a parameter of the type class so that \mathbf{m} and n may refer to it.) Also necessary are the functional dependencies that state that m determines both a and n. These dependencies rule out ambiguities during type inference.

class Iterable a m n | m -> a, m -> n where openiter :: (ExpF a -> a) -> m -> n uniter :: (ExpF a -> a) -> n -> If g is the identity type constructor, then m and n are Exp a and a respectively.

openiter = cata

instance Iterable a (Exp a) a where

= place uniter f

Using the instances for the subcomponents, we can define instances for types that contain ->.

=> Iterable a (m1 -> m2) (n1 -> n2) where instance (Iterable a m1 n1, Iterable a m2 n2) openiter $f x = openiter f \cdot x \cdot uniter f$ = uniter f . x . openiter f With these instances, we have a definition for openiter{ $|\lambda\alpha,\alpha\to\alpha|$ }. It is not difficult to add instances for other type constructors, such as lists and tuples.

2.2 Examples of iteration

We next present several additional examples of the expressiveness of iter0 for arguments of type (forall a. Exp a). The purpose of these examples is to demonstrate how to implement some of the common operations for λ -calculus terms without case analysis.

For example, we can use iter0 to convert expressions to strings. So that we have different names for

each nested binding occurrence, we must parameterize this iteration with a list of variable names. Haskell's list comprehension provides us with an infinite supply of strings.

```
vars :: [String]
```

showAux :: ExpF ([String] -> String)

showAux (App x y) vars =

-> ([String] -> String)

"(" ++ (x vars) ++ " " ++ (y vars) ++ ")"

showAux (Lam z) (v:vars) =
 "(fn " ++ v ++ ". " ++ (z (const v) vars) ++ ")"

show :: (forall a. Exp a) -> String

show e = iterO showAux e vars

Applying show to an expression produces a readable form of the expression.

```
show (lam (\x -> lam (\y -> app x y)))
                                = (fn a. (fn b. (a b)))
```

Another operation we might wish to perform for a λ -calculus expression is to reduce it to a simpler form. As an example, we next implement parallel reduction for a λ -calculus expression.⁶ Parallel reduction differs from full reduction in that it does not reduce any newly created redexes. Therefore, it terminates even for expressions with no β -normal form. Parallel reduction may be specified by the following inductive definition.

$$\frac{M \Rightarrow M'}{\lambda x.M \Rightarrow \lambda x.M'} \qquad \frac{M \Rightarrow M' \quad N \Rightarrow N'}{MN \Rightarrow M'N'}$$

⁶This example is from Schürmann et. al [24].

We use iter0 to implement parallel reduction below. The tricky part is the case for applications. We must determine whether the first component of an application is a lam expression, and if so, perform the we implement parallel reduction with a "pairing" trick? As we iterate over the term we produce two results, reduction. However, we cannot do a case analysis on expressions, as the type Exp a is abstract. Therefore, stored in the following record:

```
data PAR a = PAR { par :: Exp a, apply :: Exp a -> Exp a }
```

The first component, par, is the actual result we want—the parallel reduction of the term. The second apply performs the substitution in the reduced term. Otherwise, apply creates an app expression with its component, apply, is a function that we build up for the application case. In the case of a lam expression, argument and the reduced term.⁸

```
parallel :: (forall v. Exp v) -> (forall v. Exp v)
                                                                                                                                                                                               var x = PAR \{ par = x, apply = app x \}
                                                                                                                                                                                                                               parAux (App x y) =
   PAR { par = apply x (par y),
   apply = app (apply x (par y)) }
                                                          PAR { par = lam (par . f . var), apply = par . f . var }
parAux :: ExpF (PAR a) -> PAR a
                                                                                                                                                               var :: Exp a -> PAR a
                               parAux (Lam f) =
```

For example:

parallel x = par (iter0 parAux x)

```
show (parallel (app (lam (\x -> app x x)) (lam (\y -> y))))
```

```
= "((fn a. a) (fn a. a))"
```

conversion of Danvy and Filinski [6]. This sophisticated algorithm performs "administrative" redexes at the meta-level so that the result term has no more redexes than the original expression. The algorithm is based on two mutually recursive operations: cpsmeta performs closure conversion given a meta-level continuation (a term of type Exp a -> Exp a), and cpsobj does the same with an object-level continuation (a term of While we could not write the most natural form of parallel reduction with iter0, other operations may be expressed in a very natural manner. For example, we can implement the one-pass call-by-value CPS-

```
data CPS a = CPS {
    cpsmeta :: (Exp a -> Exp a,
    cpsobj :: Exp a -> Exp a }
```

-

If we are given a value (i.e. a λ-expression or a variable) the function value below describes its CPS conversion. Given a meta-continuation k, we apply k to the value. Otherwise, given an object continuation c, we create an object application of c to the value.

```
value :: Exp a -> CPS a value x = CPS { cpsmeta = \k -> k x, cpsobj = \k -> app c x }
```

The operation cpsAux takes an expression whose subcomponents have already been CPS converted and CPS converts it. For application, translation is the same in both cases except that the meta-case converts the meta-continuation into an object continuation with lam.

```
cpsAux :: ExpF (CPS a) -> CPS a cpsAux (App e1 e2) =
```

⁷Pairing was first used to implement the predecessor operation for Church numbers. The iteration simultaneously computes the desired result with auxiliary operations.

⁸In Haskell, the notation apply x projects the apply component from the record x.

```
CPS { cpsmeta = \k -> appexp (lam k),
                                                                                                        (cpsmeta e2) (\y2 ->
                                                                           (cpsmeta e1) (\y1 ->
                            cpsobj = appexp }
                                                        where appexp c =
```

For functions, we use value, but we must transform the function to bind both the original and continuation arguments and transform the body of the function to use this object continuation. The outer lam binds the original argument. We use value for this argument in f and cpsobj yields a body expecting an object app (app y1 y2) c))

continuation that the inner lam converts to an expression.

cpsAux (Lam f) =

```
value (lam (lam . cpsobj . f . value))
```

Finally, we start cps with iter0 by abstracting an arbitrary dynamic context a and transforming the

```
cpsmeta (iterO cpsAux x) (\m -> app a m))
                                                           cps :: (forall a. Exp a) -> (forall a. Exp a)
argument with respect to that context.
                                                                                                cps x = lam (\a ->
```

Above, \mathbf{a} is the initial continuation, \mathbf{b} is the argument \mathbf{x} , and \mathbf{c} is the continuation for the function. show (cps (lam (\x -> app x x))) = "(fn a. (a (fn b. (fn c. ((b b) c))))"

Encoding iteration in F_{ω}

In the previous section, we implemented iter as a recursive function and used a recursive type, Rec, to define Exp. To prevent case analysis, we hid this definition of Rec behind a module boundary. However, this module abstraction and is not the only way to prevent case analysis. Furthermore, term and type recursion is not necessary to implement this datatype. We may define iter and Rec in the fragment of Haskell that corresponds to F_{\sigma} [10] so that iteration is the only elimination form for Rec. This implementation appears

The encoding is similar to the encoding of covariant data types in the polymorphic λ -calculus [3] (or to the encoding of Church numerals). We encode an expression of type Exp a as its elimination form. For example, something of type Exp a should take an elimination function of type (ExpF a -> a) and return

To create an expression, roll must encode this elimination. Therefore, roll returns a function that applies its argument f (the elimination function) to the result of iterating over x. Again, to use xmap we an a. To implement cata we apply the expression to the elimination function.

```
type Rec f a = (f a -> a) -> a
data ExpF a = Lam (a -> a) | App a a
type Exp a = Rec ExpF a
```

roll :: ExpF (Exp a) \rightarrow Exp a roll x =

11.1 x =
\[\lambda = \frac{1}{2} \text{ (xmapExpF (cata f, place)) x)} \]

place :: a -> Exp a place $x = \langle f -> x$

lam :: (Exp a -> Exp a) -> Exp a lam x = roll (Lam x)

app :: Exp a -> Exp a -> Exp a app y z = roll (App y z)

```
iter0 :: (ExpF a -> a) -> (forall b. Exp b) -> a
Lam x -> Lam (g . x . f)
App y z -> App (g y) (g z))
                                                                                                                                       cata :: (ExpF a -> a) -> Exp a -> a
                                                                                                                                                                cata f x = x f
                                                                                                                                                                                                                                 iter0 = cata
```

Figure 4: Catamorphism in the F_{ω} fragment of Haskell

```
need a right inverse for cata f. The term place in Figure 4 is an expression that when analyzed returns its
                                                                                                                  argument. We can show that place is a right inverse by expanding the above definitions:
```

Reasoning about iteration

There are powerful tools for reasoning about programs written in the polymorphic \(\lambda\)-calculus. For example, we know that all programs that are written in \mathbb{F}_{ω} will terminate. Therefore, we can argue that the examples of the previous section are total on all inputs that may be expressed in the polymorphic λ calculus, such as app (lam ($x \rightarrow app x$))(lam ($x \rightarrow app x x$)). Unfortunately, we cannot argue that these examples are total for arbitrary Haskell terms. For example, calling any of these routines on (lam (let f x = f x in f)) will certainly diverge. Furthermore, even if the arguments to iteration are written in \mathbb{F}_{ω} , if the operation itself uses type or term recursion, then it could still diverge. For example, using the recursive datatype Value from Section 2, we can implement the untyped λ -calculus evaluator with Parametricity is another way to reason about programs written in \mathbb{F}_{ω} . As awkward as they may be, one of the advantages to programming with catamorphisms instead of general recursion is that we may reason about our programs using algebraic laws that follow from parametricity. While the following laws only hold for F_{ω} , we may be able to prove some form of them for Haskell using techniques developed by Johann [12].

Using parametricity, we can derive a free theorem [28] about expressions of (forall a. (b a -> a) -> a). If x has this type, then

```
f , f' = id and f , g = h , fst (xmap\{|b|\}(f,f')) => f (x\ g) = x\ h
```

The equivalence in this theorem is equivalence in some parametric model of F_{ω} , such as the term model with $\beta\eta$ -equivalence. Using the free theorem, we can prove a number of properties about iteration. First, we can show that iterating roll is an identity function, that iter0 roll = id. Using this result we can show the uniqueness property for iter, which describes when a function is equal to an application of iter. It resembles an "induction principle" for iter0.

```
f . f' = id and f . roll = h . fst (xmap\{|b|\}(f,f')) <=> f = iter0 h
```

The <= direction follows directly from the implementation of iterO and roll. The => direction follows from

Finally, the fusion law can be used to combine the composition of a function f and an iteration into one

iteration. This law follows directly from the free theorem.

```
f . f' = id and f . g = h . fst(xmap\{|b|\}(f,f')) \Rightarrow f . iter0 g = iter0 \ h
```

Adequacy states that if a F_{ω} term is of type forall a. Exp a and is in canonical form, then it should be the encoding of the canonical form of some λ -calculus expression. In other words, there is no extra "junk" in the type forall a. Exp a, such as badcase. As a first step towards proving this result, we next show how this However, there is an important property about this encoding of the λ -calculus that we have not proven. F_{ω} library can encode a language with iteration over HOAS that itself adequately embeds the λ -calculus.

Enforcing parametricity with modal types 4

In the next section, we formally describe the connection between the interface we have provided for iteration over higher-order abstract syntax and the modal calculus of Schürmann, Despeyroux and Pfenning (SDP) [24]. We do so by using this library to give a sound and complete embedding of the SDP calculus

_

```
x \mid c \mid \lozenge \mid \lambda x : A.M \mid M_1 M_2 \mid \mathbf{box} \ M \mid \mathbf{let} \ \mathbf{box} \ x : A = M_1 \ \mathbf{in} \ M_2 \mid (M_1, M_2) \mid \mathbf{fst} \ M \mid \mathbf{snd} \ M \mid \mathbf{iter} \ [A_1, A_2][\Theta] \ M
                                                                                                                                                                                                   \begin{array}{ll} \Theta &:= \varnothing \mid \Theta \uplus \{x \mapsto M\} \mid \Theta \uplus \{c \mapsto M\} \\ V &:= \varnothing \mid \Psi \uplus \{x : B\} \\ V &:= \varnothing \mid \Omega \uplus \{x : A\} \\ V &:= \varnothing \mid \Upsilon \uplus \{x : A\} \\ V &:= \varnothing \mid \Sigma \uplus \{c : B \mapsto b\} \end{array}
                                                  A ::= B \mid A_1 \to A_2 \mid A_1 \times A_2 \mid \Box A

```

Figure 5: Syntax of SDP calculus

into F_{ω} . First, we provide a brief overview of the static and dynamic semantics of this calculus. The syntax

The SDP calculus enforces the parametricity of function spaces with modal types. Modal necessity in logic is used to indicate those propositions that are true in all worlds. Consequently, these propositions interpretation of modal necessity, necessarily true propositions correspond to those formulae that can be shown to be valid. Validity is defined as derivable with respect to only assumptions that themselves are valid assumptions. As such, the typing judgments have two environments (also called contexts), one for valid assumptions, Ω , and one for "local" assumptions, Υ . The terms corresponding to the introduction and can make use of only those assumptions that are also true in all worlds. In Pfenning and Davies' [20] of the SDP calculus is shown in Figure 5.

elimination forms for modal necessity are box and let box. We give them the following typing rules:
$$\begin{array}{ll} \Omega; \varnothing \vdash M:A & \\ \hline \Omega; \varnothing \vdash \mathbf{box} M: \Box A & \\ \hline \Omega; \Upsilon \vdash \mathbf{box} M: \Box A & \\ \hline \Omega; \Upsilon \vdash \mathbf{letb} & \\ \hline \Omega; \Upsilon \vdash \mathbf{letb} & \\ \hline \end{array}$$

A **box**ed term, M, has type $\square A$ only if it has type A with respect to the valid assumptions in Ω , and no assumptions in local environment. The let box elimination construct allows for the introduction of valid assumptions into Ω , binding the contents of the boxed term M_1 in the body M_2 . This binding is allowed to think about modal necessity is that terms with boxed type are "closed" and do not contain any free because the contents of **box**ed terms are well-typed themselves with only valid assumptions. Another way Ω ; $\Upsilon \vdash \mathbf{let}$ box $x : A_1 = M_1$ in $M_2 : A_2$

Operationally, **box**ed terms behave like suspensions, while **let box** substitutes the contents of a **box**ed term for the bound variable. Because the operational semantics is defined simultaneously with conversion to canonical forms, it is parameterized by the environment Ψ that describes the types of free local variables variables, except those that are bound to closed terms themselves.

appearing in the expression.

$$\Psi \vdash M_1 \hookrightarrow \mathbf{box}\, M_1': \Box A_1 \quad \Psi \vdash M_2\{M_1'/x\} \hookrightarrow V: A_2$$

$$\Psi \vdash \mathbf{let}\, \mathbf{box}\, x: A_1 = M_1\, \mathbf{in}\, M_2 \hookrightarrow V: A_2$$
 ev_letb

To enforce the separation between the iterative and parametric function spaces, the SDP calculus defines those types, B, that do not contain a \square type to be "pure". Objects in the calculus with type $\square B$, boxed pure cannot. This forces functions of pure type, $\lambda x: B_1.M: B_1 \to B_2$, to be parametric. This is because the will not be free inside of a **box**ed expression in M. Consequently, the functions of pure type may only treat input, x, to such a function does not have a boxed pure type, and there is no way to convert it to one -xtheir inputs extensionally, making them parametric.

types, can be examined intensionally using an iteration operator, while objects of arbitrary impure type, A,

The language is parameterized by a constant type b and a signature, Σ , of data constructor constants, c, for that base type. Each of the constructors in this signature must be of type $B \to b$. Because B is a pure

type, these constructors may only take parametric functions as arguments.

14 For example, consider a signature describing the untyped
$$\lambda$$
-calculus, $\Sigma = \{ \mathbf{app} : b \times b \to b, \mathbf{lam} : (b \to b) \}$

 $b \rightarrow b$, where the constant type b corresponds to Exp. Using this signature, we can write a function to count the number of bound variables in an expression, as we did in Section 2.9

r of bound variables in an expression, as we did in Section
$$\mathbf{countvar} \triangleq \lambda x : \Box b.$$

$$\mathbf{iter}[\Box b, \mathbf{int}][\{\mathbf{app} \mapsto \lambda y : \mathbf{int}.\lambda z : \mathbf{int}.y + z, \\ \mathbf{lam} \mapsto \lambda f : \mathbf{int} \to \mathbf{int}.f1\}] x$$

The term iter intensionally examines the structure of the argument x and replaces each occurrence of app and lam with $\lambda y : int. \lambda z : int. y + z$ and $\lambda f : int \rightarrow int. f 1$ respectively.

The typing rule for iter is the following:

$$\begin{array}{ll} \Omega; \Upsilon \vdash M : \Box B & \Omega; \Upsilon \vdash \Theta : A\langle \Sigma \rangle \\ \Omega; \Upsilon \vdash \mathbf{iter} \left[\Box B, A \right] [\Theta] \ M : A\langle B \rangle \end{array} \label{eq:definition}$$
 tp_iter

The argument to iteration, M, must have a pure closed type to be analyzable. Analysis proceeds via walking over M and using the replacement Θ , a finite map from constants to terms, to substitute for the constants in the term M. The type A is the type that will replace the base type b in the result of iteration. The notation

also agree with replacing b with A. We verify this fact with the judgment Ω ; $\Upsilon \vdash \Theta : A(\Sigma)$, which requires $A\langle B \rangle$ substitutes A for the constant b in the pure type B. Each term in the range of the replacements must that if $\Theta(c) = M_c$ and $\Sigma(c) = B_c$, then M_c must have type $A\langle B_c \rangle$.

Operationally, iteration in the SDP calculus works in the following fashion.

$$\begin{split} \Psi \vdash M &\hookrightarrow \mathbf{box} \, M' : \Box B \\ & \varnothing \vdash M' \, \Uparrow V' : B \\ \Psi \vdash \langle A, \Psi, \Theta \rangle (V') &\hookrightarrow V : A \langle B \rangle \\ \Psi \vdash \mathbf{iter} \, [\Box B, A][\Theta] \, M \hookrightarrow V : A \langle B \rangle \quad \text{ev_it} \end{split}$$

First, the argument to iteration M is evaluated, $\Psi \vdash M \hookrightarrow \mathbf{box} M' : \Box B$, producing a \mathbf{boxed} object M'. M' is then evaluated to η -long canonical form via $\varnothing \vdash M' \Uparrow V' : B$. Next we perform elimination of that canonical form, $\langle A, \Psi, \Theta \rangle(V')$, walking over V' and using Θ to replace the occurrences of constants. Finally, we evaluate that result, $\Psi \vdash \langle A, \Psi, \Theta \rangle(V') \hookrightarrow V : A\langle B \rangle$.

Elimination is used to describe the structure of a term after iteration. The only interesting cases to elimination are those for variables, constants, and abstractions.

$$\begin{array}{c} \langle A, \Psi, \Theta \rangle (x) \triangleq \Theta (x) & \text{el-var} & \overline{\langle A, \Psi, \Theta \rangle (c)} \triangleq \Theta (c) \\ \hline \langle A, \Psi \uplus \{x' : B\}, \Theta \uplus \{x \mapsto x'\} \rangle (V) \triangleq M \\ \hline \langle A, \Psi, \Theta \rangle (\lambda x : B.V) \triangleq \lambda x' : A \langle B \rangle. M & \text{el-Jam} \\ \hline \end{array}$$

then eliminates recursively on the body M of the abstraction, wrapping the result with an abstraction of the correct type, one where b is replaced by A. The variable and the constant cases use the mappings in the When elimination encounters an abstraction, it chooses a fresh variable and adds it to the mapping Θ . It

First, while the language presented in this paper has only one pure base type b, the SDP calculus allows the types is straightforward. Also, in order to make the constants of the pure language more closely resemble datatype constructors, we have forced them all to be of the form $B \to b$ instead of any arbitrary pure type B. To facilitate this restriction, we add unit and pairing to the pure fragment of the calculus so that In order to simplify the presentation of the encoding, we have made a few changes to the SDP calculus. signature Σ to contain arbitrarily many base types. However, the extension of the encoding to several base constructors may take any number of arguments.

⁹For simplicity, our formal presentation of SDP (in Figure 5) does not include integers. However, it is straightforward to extend this calculus to additional base types.

(Type Environment) (Term Environment)

5 Encoding SDP in F_{ω}

The terms that we defined in Section 3, roll and iter, correspond very closely to the constructors and iteration primitive of the SDP calculus. In this section, we strengthen this observation by showing how to encode all programs written in the SDP calculus into F_{ω} using a variation of these terms.

There are two key ideas behind our encoding:

• We use type abstraction to ensure that the encoding of boxed objects obeys the closure property of the To do so, we parameterize our encoding by a type that represents the current world and maintain the invariant that all variables in the local environment mention the current world in their types. Because a term enclosed within a **box** must be well-typed in any world, when we encode a **box**ed term we use world and wrap the result with a type abstraction. As a consequence, the encoding of a data-structure within a box cannot contain free local variables because their types would mention that fresh type source language, and prevents variables from the local environment from appearing inside these terms. a fresh type variable to create an arbitrary world. We then encode the enclosed term with that new variable outside of the scope of the type abstraction. We encode constants in the source language as their elimination form with roll. Furthermore, we restrict the result of elimination to be of the type that is the world in which the term was encoded. However, the encoding of \mathbf{box} ed expressions quantifies over that world, allowing the resulting computations to be of arbitrary type. The encoding of the SDP calculus can be broken into four primary pieces: the encodings for signatures, types, terms, and replacements. To simplify our presentation, we extend the target language with unit, void, results as there are well known encodings of these types into F_{ω} . In the remainder of this section, we present the details of the encoding and describe the most interesting cases. The full specification of this encoding products, and variants. The syntax of these terms appears in Figure 6. This extension does not weaken our appears in Appendix B. **Signatures.** The encoding of signatures in the SDP calculus, notated $\tau\langle\Sigma\rangle$, corresponds to generating the type constructor whose fixed point defines the recursive datatype. (For example, ExpF in Section 2.) The argument of the encoding, a specified world τ , corresponds to the argument of the type constructor.

For this encoding, we assume the aid of an injective function $\mathcal L$ that maps data constructors in the notated $\tau \langle B \rangle$ and defined in Appendix B.1. This operation parameterizes pure types in the source calculus with respect to a given world in the target language, and produces a type in the target language. Essentially, source language to distinct labels in the target language. We also need an operation called parameterization, $\tau\langle B \rangle$ "substitutes" the type τ for the base type, b, in B.

We encode a signature as a variant. Each field corresponds to a constant c_i in the signature, with a label according to \mathcal{L} , and a type that is the result of parameterizing the argument type of c_i with the provided

$$\begin{array}{cc} \forall c_i \in \mathrm{dom}(\Sigma) & \Sigma(c_i) = B_i \to b \\ \tau(\Sigma) \triangleq \langle \mathcal{L}(c_1) : \tau\langle B_1 \rangle, \dots, \mathcal{L}(c_n) : \tau\langle B_n \rangle \rangle \end{array} \text{ en sig}$$

1

We often use parameterization and the signature translation to build type constructors in the target language, so we define the following two abbreviations:

$$B^* \triangleq \lambda \alpha : \star . \alpha \langle B \rangle \qquad \Sigma^* \triangleq \lambda \alpha : \star . \alpha \langle \Sigma \rangle$$

they occur. We write the judgment for encoding a type A in the source calculus in world τ as $\Delta \vdash A \rhd_{\tau} \tau'$. The environment Δ tracks type variables allocated during the translation and allows us to chose variables that are not in scope. The two interesting cases for encoding types from the source calculus are those for we define the abbreviation Rec $\Sigma^* \alpha \triangleq (\Sigma^* \alpha \to \alpha) \to \alpha$, intuitively a fixed point of Σ^* , to the same idea of Types. As with the encoding of signatures, the encoding of types is parameterized by the worlds in which the base type and for boxed types. The case for b corresponds to Rec ExpF a from Section 3. Therefore, encoding a datatype as its elimination form.

$$\overline{\Delta} \vdash b \rhd_{\tau} \operatorname{Rec} \ \overline{\Sigma^*} \ \overline{\tau}$$
 en_tp_b

Naïvely, we might expect to use a fresh type variable as the new world and then encode the contents of the boxed type with that type variable. This encoding ensures that the type is parametric with respect to its The rule for boxed types uses type abstraction to ensure the result is parametric with respect to its world. world and then quantifies over the result.

$$\frac{\alpha \not\in \Delta \quad \Delta \uplus \{\alpha:\star\} \vdash A \rhd_{\alpha} \tau'}{\Delta \vdash \Box A \rhd_{\tau} \forall \alpha:\star\tau'} \text{ en_tp_box_wrong}$$

However, with this encoding we violate the invariant that the types of all free local variables mention the will be encoded with a stack of world transformers, somewhat akin to stack of environments in the implicit current world, because the encoding does not involve τ . Instead, we use the fresh type variable to create a new world from the current world and consider α as a "world transformer". During the translation, a term formulation of modal types [7].

$$\frac{\alpha \not\in \Delta \quad \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \, \tau'}{\Delta \vdash \Box A \rhd_{\tau} \, \forall \alpha: \star \to \star. \tau'} \text{ en_tp_box}$$

The naïve translation of the unit type also forgets the current world. For this reason, we add a non-standard unit to F_{ω} that is parameterized by the current world. In other words, the unit type 1 is of kind $\star \to \star$ and the unit term $\langle \rangle$ has type $\forall \alpha : \star .1(\alpha)$. Our type translation instantiates this type with the current world.

$\overline{\Delta \vdash 1 \rhd_{\tau} 1(\tau)}$ en_tp_unit

The remaining types in the SDP language are encoded recursively in a straightforward manner. The complete rules can be found in Appendix B.3.

addition to the current world, τ , and the set of allocated type variables, Δ , the encoding of terms is also **Terms and replacements.** We encode the source term, M, with the judgment $\Delta; \Xi \vdash M \rhd_{\tau} e$. In parameterized by a set of term variables, Ξ. This set of variables allows the encoding to distinguish between variables that were bound with λ and those bound with let box. We will elaborate on why this set is necessary shortly. Our encoding of **box**ed terms follows immediately from the encoding of **box**ed types. Here we encode the argument term with respect to a fresh world transformer applied to the present world and then wrap the result with a type abstraction.

$$\begin{array}{c|c} \alpha \not \in \Delta & \Delta \uplus \{\alpha: \star \to \star\}; \Xi \vdash M \rhd_{\alpha\tau} e \\ \hline \Delta; \Xi \vdash \mathbf{box} M \rhd_{\tau} \Lambda \alpha: \star \to \star.e \end{array} \text{en_box}$$

$$\mathbf{xmap}\{\tau: \star \to \star\} : \forall \alpha: \star \cdot \forall \beta: \star \cdot (\alpha \to \beta \times \beta \to \alpha) \to (\tau\alpha \to \tau\beta \times \tau\beta \to \tau\alpha)$$

openiter
$$\{\tau: \star \to \star\}: \forall \alpha : \star. (\Sigma^* \alpha \to \alpha) \to \tau(\operatorname{Rec} \Sigma^* \alpha) \to \tau \alpha$$

 $\mathbf{openiter} \{\!\!\{\tau: \star \to \star\}\!\!\!\} \triangleq \Lambda\alpha: \star.\lambda f: \Sigma^*\alpha \to \alpha.\mathbf{fst} \left(\mathbf{xmap} \{\!\!\{\tau\}\!\!\!\} [\mathsf{Rec} \; \Sigma^* \; \alpha][\alpha] \langle \mathbf{cata}[\alpha]f, \mathbf{place}[\alpha]\rangle \right)$

$$\text{iter}\{\tau: \star \to \star\} : \forall \gamma : \star \cdot \vee \alpha : \star \cdot (\Sigma^* \alpha \to \alpha) \to (\forall \beta : \star \to \star \cdot \tau (\text{Rec } \Sigma^* \ (\beta \gamma)) \to \tau \alpha \\ \text{iter}\{\tau: \star \to \star\} \triangleq \Delta \gamma : \star \cdot \lambda \alpha : \star \cdot \lambda f : \Sigma^* \alpha \to \alpha . \lambda x : (\forall \beta : \star \to \star \cdot \tau (\text{Rec } \Sigma^* \ (\beta \gamma))). \text{openiter}\{\tau\}[\alpha]f(x[\lambda \delta : \star \cdot \alpha])$$

 $\mathbf{roll}: \forall \alpha : \star. \Sigma^*(\mathsf{Rec}\ \Sigma^*\ \alpha) \to \mathsf{Rec}\ \Sigma^*\ \alpha$

 $\mathbf{roll} \triangleq \Lambda \alpha \colon \star . \lambda x \colon \Sigma^*(\mathsf{Rec}\ \Sigma^*\ \alpha) . \lambda f \colon \Sigma^* \alpha \to \alpha . f(\mathbf{openiter} \{\!\!\{ \Sigma^* \}\!\!\} [\alpha]\ f\ x)$

Figure 7: Library routines

We encode let box by converting it to an abstraction and application in the target language. However, one might note the discrepancy between the type of the variable we bind in the abstraction and the type we might naïvely expect.

$$\begin{array}{c} \Delta \vdash \Box A_1 \rhd_{\tau} \tau_1 \\ \Delta_1 \Xi \vdash M_1 \rhd_{\tau} e_1 \quad \Delta_1 \Xi \uplus \{x\} \vdash M_2 \rhd_{\tau} e_2 \\ \Delta_2 \Xi \vdash \mathbf{let \ box} \ x : A_1 = M_1 \ \mathbf{in} \ M_2 \rhd_{\tau} (\lambda x : \tau_1 \cdot e_2) e_1 \end{array}$$
en_let

The type of x is A_1 and so one might assume that the type of x in the target should be the encoding of A_1 in the world τ . However, let box allows us to bind variables that are accessible in any world and using A_1 encoded against τ would allow the result to be used only in the present world. Because the encoding of M_1 will evaluate to a type abstraction, a term parametric in its world, we do not immediately unpack it by instantiating it with the current world. Instead we pass it as x and then, when x appears we instantiate it with the current world. Consequently, we use Ξ to keep track of variables bound by let box. When encoding variables, we check whether x occurs in Ξ and perform instantiations as necessary

$$x \notin \Xi$$
 en_var $x \in \Xi$ en_bv

If the variable is in Ξ , then it is applied to a world transformer that ignores its argument, and returns the

abstraction substituted for x with the world τ . Doing so ensures that if we substitute the encoding of a boxed term into the encoding of another boxed term, the type correctness of the embedding is maintained by correctly propagating the enclosing world.

present world. This essentially replaces the bottom of the world transformer stack captured by the type

Figure 7 shows the types and definitions of the library routines used by the encoding. The only difference between it and Figure 4 is that iter abstracts the current world and requires that its argument be valid in any transformation of the current world. Again, we make use of the polytypic function **xmap** to lift **cata** to arbitrary type constructors. Because **xmap** is defined by the structure of a type constructor τ , we cannot directly define it as a term in \mathbb{F}_{ω} . Instead, we will think of **xmap** $\{\tau\}$ as macro that expands to the mapping function for the type constructor τ . (We use the notation $\{\cdot\}$ to distinguish between polytypic instantiation

Encoding constants in the source calculus makes straightforward use of the library routine roll. We simply translate the constant into an abstraction that accepts a term that is the encoding of the argument

of the constant, and then uses roll to transform the injection into the encoding of the base type, Rec Σ^* τ .

$$\frac{\Sigma(c) = B \to b \quad \Delta \vdash B \rhd_\tau \, \tau_B}{\Delta; \Xi \vdash c \rhd_\tau \, \lambda x : \tau_B. \mathrm{roll}[\tau](\mathrm{inj}_{\mathcal{L}(c)} \, x \, \, \mathrm{of} \, \Sigma^*(\mathrm{Rec} \, \Sigma^* \, \tau))} \ \, \mathrm{en_con}$$

type constructor created from parameterizing B, and then apply it to the current world and the encodings The encoding of iteration is similarly straightforward. We instantiate our polytypic function iter with a of the intended result type A, the replacement term Θ and argument term M.

$$\frac{\Delta \vdash A \rhd_{\tau} \tau_{A} \quad \Delta; \Xi \vdash \Theta \rhd_{\tau}^{\tau_{A}} e_{\Theta} \quad \Delta; \Xi \vdash M \rhd_{\tau} e_{M}}{\Delta; \Xi \vdash \text{iter} \left[\Box B, A \right] [\Theta] \quad M \rhd_{\tau} \text{ iter} \left\{B^{*}\right\} [\tau] [\tau_{A}] e_{\Theta} e_{M}} \text{ en_{iter}}$$

an abstraction that consumes an instance of an encoded signature, dispatching the variant using a case The encoding of replacements Θ is uncomplicated and analogous to the encoding of signatures. We construct expression. In each branch, the encoding of the corresponding replacement is applied to the argument of the

injection.

$$\begin{aligned} & \forall c_i \in \text{dom}(\Theta) \quad \Delta; \Xi \vdash \Theta(C_i) \rhd_\tau e_i \\ \Delta; \Xi \vdash \Theta \rhd_\tau^{\tau_A} \lambda x : \Sigma^* \tau_A. \text{case } x \text{ of } \text{inj}_{\mathcal{L}(c_i)} y_1 \text{ in } (e_1 y_1) \end{aligned} = \underbrace{\dots}_{\text{inj}_{\mathcal{L}(c_n)} y_n \text{ in } (e_n y_n)}$$

together to construct a term e in our target calculus using the initial judgment $\varnothing; \varnothing \vdash M \rhd_0 e$. We use the The encodings for the other terms in the source language are straightforward and appear in Appendix B.4. Now that we have defined all of our encoding for any closed term M in the SDP calculus, we put everything void type as the initial world to enforce the parametricity of unboxed constants.

5.1 Properties of the encoding

We have proven a number of desirable properties concerning this encoding. However, before we can state calculi. These relations hold when all types from the local environment are encoded with the current world, these properties, we must first define the relationship between the environments in the source and target and all types from the valid environment are first boxed then encoded with any world. **Definition 5.1 (Encoding typing environments).** We write $\Delta \vdash \Upsilon \rhd_{\tau} \Gamma_1$ and $\Delta \vdash \Omega \rhd \Gamma_2$ to mean that

$$\forall x.x. A \in \Upsilon \Leftrightarrow x: \tau_A \in \Gamma_1 \quad \text{where } \Delta \vdash \tau: \star \text{ and } \Delta \vdash A \rhd_\tau \tau_A \\ \forall x.x. A \in \Omega \Leftrightarrow x: \tau_A \in \Gamma_2 \quad \text{where there exists some } \Delta \vdash \tau': \star \text{ such that } \Delta \vdash \Box A \rhd_\tau \tau_A$$

The relation for valid environments above is not parameterized by the current world. A single valid environment may be encoded as many different target environments, depending on what worlds are chosen for each type in the environment. However, in some sense the encodings are equivalent. If the translation of M type checks with one encoding of Ω , it will type check with any other encoding of Ω .

The encoding is type preserving. If we encode a well-typed term M, the resulting term will be well-typed term M is well-typed in the target language, then M must have been well-typed in the source. This means under the appropriately translated environment. Furthermore, the converse is also true. If the encoding of a that the target language preserves the abstractions of the source language. Theorem 5.2 (Static correctness). Assume $\Delta \vdash \Upsilon \rhd_{\tau} \Gamma_1$ and $\Delta \vdash \Omega \rhd \Gamma_2$ and $\Delta \vdash A \rhd_{\tau} \tau_A$.

1. If
$$\Delta; \operatorname{dom}(\Omega) \vdash M \rhd_{\tau} e$$
 then $\Omega; \Upsilon \vdash M : A \Leftrightarrow \Delta; \Gamma_1 \uplus \Gamma_2 \vdash e : \tau_A$.

Proof. By mutual induction over the translation of terms $(\Delta; \text{dom}(\Omega) \vdash M \rhd_{\tau} e)$ and of replacements 2. If Δ ; dom $(\Omega) \vdash \Theta \rhd_{\tau^A}^{\tau_A} e_{\theta}$ then Ω ; $\Upsilon \vdash \Theta : A(\Sigma) \Leftrightarrow \Delta$; $\Gamma_1 \uplus \Gamma_2 \vdash e_{\theta} : \Sigma^* \tau_A \to \tau_A$.

Furthermore, source evaluation and canonicalization is the same as $\beta\eta$ -equivalence in the target calculus.

 $(\Delta; \operatorname{dom}(\Omega) \vdash \Theta \rhd_{\tau}^{\tau_A} e_{\theta}).$

П

Theorem 5.3 (Dynamic correctness). If $\varnothing : \Psi \vdash M : A \text{ and } \varnothing : \Psi \vdash M \rhd_{\tau} e \text{ and } \varnothing : \Psi \vdash V \rhd_{\tau} e' \text{ and}$ $\varnothing \vdash A \rhd_{\tau} \tau_{A} \text{ and } \Delta \vdash \Psi \rhd_{\tau} \Gamma \text{ then }$

- 1. $\Psi \vdash M \hookrightarrow V : A \Leftrightarrow \varnothing; \Gamma \vdash e \equiv_{\beta\eta} e' : \tau_A$.
- 2. $\Psi \vdash M \uparrow V : A \Leftrightarrow \varnothing ; \Gamma \vdash e \equiv_{\beta\eta} e' : \tau_A$.

Proof. The forward direction follows by simultaneous induction on the evaluation of M ($\Psi \vdash M \hookrightarrow V : A$) and the conversion of M to canonical form $(\Psi \vdash M \uparrow V : A)$. The reverse direction follows from the forward direction and from the fact that evaluation in the SDP calculus is deterministic and total.

Future work

Although we have shown a very close connection between SDP and its encoding in F_{ω} , we have not shown that this encoding is adequate. We would like to show that if τ is the image of an SDP type, then all terms τ . Showing this result would also show that encoding the λ -calculus with **app** and **lam** is adequate, because of type τ are equivalent to the encoding of some SDP term. In other words, there is no extra "junk" of type

Alternatively, we could try to show adequacy with respect to the λ -calculus directly using a different method. It may also be possible to do so for the simpler encoding of modal types, informally presented in the first part of the paper, that uses first-order quantification and discards the current world. Whereas this the SDP calculus can already adequately encode the λ -calculus.

simpler encoding allows the translation of some terms that are rejected by the SDP calculus to type check (for example, $\lambda x : \Box b$. box x), it may still be adequate for encoding the untyped λ -calculus.

be defined with iter, the SDP calculus also includes a construct for case analysis of closed terms. However, One important extension of this work is the case operator. Because there are limitations to what may we have not yet found an obvious correspondence for case in our encoding. Another further area of investigation is into the dual operation to iter, the anamorphism over datatypes with embedded functions. An implementation of this operation, called coiter, is below. The coiter term is an anamorphism—it generates a recursive data structure from an initial seed.

```
data Dia f a = In (f (Dia f a), a)
coroll :: Dia f a -> f (Dia f a)
coroll (In x) = fst x
coplace :: Dia f a -> a
coplace (In x) = snd x
```

coiter0 :: (a -> f a) -> a -> (exists a. Dia f a) In (snd (xmap (coplace, coiterO g) (g b)), b) coiter0 g b =

Instead of embedding the recursive type in a sum, we embed it in a product. The two selectors from this where we would have used cata in the definition of ana. A term of type (exists a. Dia b a) corresponds embedded functions.) From a logical point of view, this restriction makes sense. Combining anamorphisms product have the dual types to roll and place. In the definition of coiter0 we use coplace as the inverse to the possibility type $(\diamond b)$ in a modal calculus. However, while a general anamorphism is an inverse of a catamorphism, coiter is not an inverse to iter. In fact, iter cannot consume what coiter produces, giving doubts to its practical use. (On the other hand, ana itself has seen little practical use for datatypes with and catamorphisms (even for datatypes without embedded functions) leads to general recursion. The technique we present, using polymorphism to enforce parametricity, has appeared under various guises in the literature. For example, Shao et al. [27] use this technique (one level up) to implement type-level intensional analysis of recursive types. They use higher-order abstract syntax to the represent recursive types and remark that the kind of this type constructor requires a parametric function as its argument. However, they do not make a connection with modal type systems, nor do they extend their type-level iteration operator to higher kinds. Xi et al. [31] remark on the correspondence between HOAS terms with

the place operator (which they call HOASvan) and closed terms of Mini-ML $_{a}^{c}$ but do not investigate the relationship or any form of iteration.

While higher-order abstract syntax has an attractive simplicity, the difficulties programming and reasoning about structures encoded with this technique have motivated research into language extensions for working with higher-order abstract syntax or alternative approaches altogether. Dale Miller developed a small language called ML_{λ} [17] that introduces a type constructor for terms formed by abstracting out a parameter. These types can be thought of as function types that can be intensionally analyzed through pattern matching. Pitts and Gabbay built on the theory of FM-sets to design a language called FreshML [23]

that allows for the manipulation and abstraction of fresh "names". Nanevski [18] combines fresh names with modal necessity to allow for the construction of more efficient residual terms, while still retaining the ability to evaluate them at runtime. The Delphin Project [25] by Schürmann et al. develops a functional language for manipulating datatypes that are terms in the LF logical framework. Because higher-order abstract syntax is the primary representation technique in LF, Delphin provides operations for matching over higher-order LF terms in regular worlds. The SDP calculus uses modal necessity to restrict matching to closed worlds, so regular worlds provide additional flexibility without the difficulties of matching in an open world. The Hybrid [2] logical framework provides induction over higher-order abstract syntax by evaluation to de Bruijn There is a long history of encoding modality in logic, but only recently has the encoding of modal type systems been explored. Acar et al. [1] use modal types in a functional language that provides control over the use of memoization, and implement it as a library in SML. Because SML does not have modal types or first-class polymorphism, they use run-time checks to enforce the correct use of modality. Davies terms, which provide straightforward induction.

and Pfenning [7] presented, in passing, a simple encoding of the modal λ -calculus into the simply-typed λ-calculus that preserves only the dynamic semantics. Washburn expanded upon this encoding, showing that it bisimulates the source calculus [29].

8 Conclusion

While other approaches to defining an induction operator over higher-order abstract syntax require type system extensions to ensure the parametricity of embedded function spaces, the approach that we present in this paper requires only type polymorphism. Because of this encoding, we are able to implement iteration operators for datatypes with embedded parametric functions directly in the Haskell language. However, despite its simplicity, our approach is equivalent to previous work on induction operators for HOAS. We demonstrate this generality by showing how the modal calculus of Schüermann, Despeyroux and Pfenning may be embedded into F_{ω} using this technique. In fact, the analogy of representing **box**ed terms with polymorphic terms makes semantic sense: a proposition with a boxed type is valid in all worlds and polymorphism makes that quantification explicit.

Acknowledgements

We thank Margaret DeLap, Eijiro Sumi, Stephen Tse, Stephan Zdancewic, and the anonymous ICFP reviewers for providing us with feedback concerning this paper. The first author would like to thank Frank Pfenning for instilling within him an attention to detail

3 Static correctness

Our notion of static correctness is that encoding is type preserving. If we encode a well-typed term M, the been well-typed in the source. This means that the target language preserves the abstractions of the source language. However, because we allow for the encoding of open terms, before we can begin to reason about converse is also true. If the encoding of a term M is well-typed in the target language, then M must have static correctness and other properties, we must first define a relationship between source and target resulting term will be well-typed under the appropriately translated environment. Furthermore, the language environments.

Definition C.1 (Encoding typing environments). We write $\Delta \vdash \Upsilon \rhd_{\tau} \Gamma_1$ and $\Delta \vdash \Omega \rhd \Gamma_2$ to mean

$$\forall x.x.: A \in \Upsilon \Leftrightarrow x: \tau_A \in \Gamma_1 \quad \text{where } \Delta \vdash \tau: \star \text{ and } \Delta \vdash A \rhd_\tau \tau_A$$

$$\forall x.x.: A \in \Omega \Leftrightarrow x: \tau_A \in \Gamma_2 \quad \text{where there exists some } \Delta \vdash \tau': \star \text{ such that } \Delta \vdash \Box A \rhd_{\tau'} \tau_A$$

environment may be encoded at many different target environments, depending on what worlds are chosen for each type in the environment. However, in a sense the encodings are equivalent. If the translation of MThe relation for valid environments above is not parameterized by the current world. A single valid type checks with one encoding of Ω , it will type check with any other encoding of Ω .

The following theorem proves our primary static correctness result, supported by a number of lemmas

Theorem C.2 (Static correctness).

- 1. If Δ ; dom $(\Omega) \vdash M \rhd_{\tau} e$ then if $\Delta \vdash \Upsilon \rhd_{\tau} \Gamma_1$ and $\Delta \vdash \Omega \rhd \Gamma_2$ and $\Delta \vdash A \rhd_{\tau} \tau_A$ then $\Omega; \Upsilon \vdash M : A \Leftrightarrow \Delta; \Gamma_1 \uplus \Gamma_2 \vdash e : \tau_A.$
- 2. If Δ ; dom(Ω) $\vdash \Theta \rhd_{\tau^A}^{\tau_A} e_{\Theta}$ then if $\Delta \vdash \Upsilon \rhd_{\tau} \Gamma_1$ and $\Delta \vdash \Omega \rhd \Gamma_2$ and $\Delta \vdash A \rhd_{\tau} \tau_A$ then $\Omega; \Upsilon \vdash \Theta : A\langle \Sigma \rangle \Leftrightarrow \Delta; \Gamma_1 \uplus \Gamma_2 \vdash e_\Theta : \Sigma^* \tau_A \to \tau_A.$

Proof. By mutual induction over the structure of Δ ; dom $(\Omega) \vdash M \rhd_{\tau} e$ and Δ ; dom $(\Omega) \vdash \Theta \rhd_{\tau^{A}}^{\tau} e_{\Theta}$. The cases for former:

Case

$$\frac{x \notin \mathrm{dom}(\Omega)}{\Delta; \mathrm{dom}(\Omega) \vdash x \rhd_{\tau} x} \text{ en_var}$$

Forward direction:

- By inversion on Ω : $\Upsilon \vdash x : A$ and $x \notin \text{dom}(\Omega)$ we can conclude that $A = \Upsilon(x)$.
- By Definition C.1 (environment encoding), if $\Upsilon(x) = A$ then $\Gamma_1(x) = \tau'_A$ where $\Delta \vdash A \rhd_\tau \tau'_A$.
- Lemma C.13 (uniqueness of type encoding) on $\Delta \vdash A \rhd_{\tau} \tau_A$ and $\Delta \vdash A \rhd_{\tau} \tau'_A$ we have $\tau_A = \tau'_A$.
- Using Lemma C.20 (environment encoding well-formedness) we have $\Delta \vdash \Gamma_1$ and $\Delta \vdash \Gamma_2$, and along with $\Gamma_1(x) = \tau_A$, the variable typing rule (tp_var), and weakening we can conclude $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash x : \tau_A$.

Backward direction:

By Lemma C.8 (inversion) on $\Delta; \Gamma_1 \oplus \Gamma_2 \vdash x : \tau_A$ we know that $x : \tau_A' \in \Gamma_1 \oplus \Gamma_2$ where $\Delta \vdash \tau_A \equiv \beta_\eta \ \tau_A' : \star$. Furthermore, we know that $x \not\in \text{dom}(\Omega)$ so by Defintion C.1 (environment encoding) $x \not\in \text{dom}(\Gamma_2)$ and the disjointness of contexts means that $x : \tau_A' \in \Gamma_1$.

 $\Delta \vdash A' \rhd_{\tau} \tau'_{A}$. Using Lemma C.12 (type enconding with congruent results) on $\Delta \vdash A \rhd_{\tau} \tau_{A}$ and $\Delta \vdash A' \rhd_{\tau} \tau'_{A}$ with $\Delta \vdash \tau_{A} \equiv \beta_{\eta} \tau'_{A} : \star$, we can conclude A = A' Therefore by the local variable typing rule (tp-var) on $x : A \in \Upsilon$ we can conclude $\Omega; \Gamma \vdash x : A$. Definition C.1 (environment encoding) tells us that if $x: \tau_A' \in \Gamma_1$ then $x: A' \in \Upsilon$ where

Case

$$\frac{x \in \text{dom}(\mathfrak{U})}{\Delta; \text{dom}(\Omega) \vdash x \rhd_{\tau} x[\lambda\alpha : \star.\tau]} \text{ en_bvar}$$

Forward direction:

- By inversion on Ω ; $\Upsilon \vdash x : A$ and $x \in \text{dom}(\Omega)$ we can conclude that $A = \Omega(x)$.
- By Definition C.1 (environment encoding), if $\Omega(x) = A$ then $\Gamma_2(x) = \tau'_A$ where $\Delta \vdash \Box A \rhd_{\tau'} \tau'_A$ for some $\Delta \vdash \tau' : \star$. By inversion, we know that $\Delta \uplus \{\beta : \star \to \star\} \vdash A \rhd_{\beta\tau'} \tau''_A$ where $\tau_A' = \forall \beta : \star \to \star : \tau_A''.$
- Using Lemma C.20 (environment encoding well-formedness) we have $\Delta \vdash \Gamma_1$ and $\Delta \vdash \Gamma_2$, and along $\Gamma_2(x) = \forall \beta : \star \to \star \cdot \tau''_A$ and the variable typing rule (tp_var), the type application rule (tp_tapp) and weakening we can derive $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash x[\lambda\alpha : \star.\tau] : \tau_A''\{\lambda\alpha : \star.\tau/\beta\}$.
- $\Delta \oplus \{\beta: \star \to \star\} \vdash A \rhd_{\beta\tau'} \tau''_A$ we know that $\Delta \vdash A \rhd_{(\lambda\alpha:\star,\tau)\tau'} \tau''_A \{\lambda\alpha:\star,\tau/\beta\}$. By β -equivalence (tp-eq_abs_beta) we know that $\Delta \vdash \tau \equiv \beta_\eta (\lambda\alpha:\star,\tau)\tau':\star$, so by Lemma C.14 (encoding under congruent worlds) on $\Delta \vdash A \rhd_{\tau} \tau_A$ and $\Delta \vdash A \rhd_{(\lambda\alpha;\star,\tau)\tau'} \tau''_A \{\lambda\alpha:\star,\tau/\beta\}$ we know that By Lemma C.15 (world substitution on type encoding) on $\Delta \vdash \lambda \alpha : \star .\tau : \star \to \star$ and $\Delta \vdash \tau_A \equiv_{\beta\eta} \tau_A'' \{ \lambda \alpha : \star .\tau / \beta \} : \star$.

c

Therefore, by type equivalence (tp-eq) on $\Delta \vdash \tau_A \equiv_{\beta\eta} \tau''_A \{ \lambda\alpha : \star \cdot \tau/\beta \} : \star$ we can conclude $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash x[\lambda \alpha : \star.\tau] : \tau_A.$

Backward direction:

- (environment encoding) we have that $x \in \text{dom}(\Gamma_2)$. Given that contexts are disjoint, $x : \tau''_A \in \Gamma_2$. From Lemma C.8 (inversion) on Δ , $\Gamma_1 \uplus \Gamma_2 \vdash x[\lambda\alpha : \star \cdot \tau] : \tau_A$ we know Δ , $\Gamma_1 \uplus \Gamma_2 \vdash x : \forall \beta : \kappa \cdot \tau_A'$ and $\Delta \vdash \lambda \alpha : \star \tau : \kappa$ where $\Delta \vdash \tau_A \equiv_{\beta \eta} \tau'_A \{\tau_1/\beta\} : \star$ and $\Delta \vdash \tau_1 \equiv_{\beta \eta} \lambda \alpha : \star \tau : \kappa$. By further inversion on $\Delta : \Gamma_1 \uplus \Gamma_2 \vdash \kappa : \forall \beta : \kappa . \tau'_A$ we can conclude $x : \tau''_A \in \Gamma_1 \uplus \Gamma_2$ for $\Delta \vdash \forall \beta : \kappa . \tau'_A \equiv \beta_\eta \ \tau''_A : \star$. By However, we know that $x \in \text{dom}(\Omega)$ so by Definition C.1
- By inversion on $\Delta \vdash \lambda \alpha : \star .\tau : \kappa$ we know that $\kappa = \star \to \star$.
- Definition C.1 (environment encoding) also allows us to conclude that given $x: \tau_A'' \in \Gamma_2$, we have $x: A' \in \Omega$ where $\Delta \vdash \Box A' \rhd_{\tau'} \tau'_A$ for some $\Delta \vdash \tau' : \star$.
- By using the typing rule for valid variables (tp_bvar) on $x: A' \in \Omega$ we can conclude $\Omega; T \vdash x: A'$.
 - By inversion on $\Delta \vdash \Box A' \rhd_{\tau'} \tau''_A$ we have that $\Delta \uplus \{\beta : \star \to \star\} \vdash A' \rhd_{\beta\tau'} \tau''_A$ where $\tau_A''' = \forall \beta : \star \to \star : \tau_A'''.$
- Using Lemma C.15 (world substitution) on $\Delta \vdash \lambda \alpha : \star \cdot \tau : \star \to \star$ and
- $\Delta \uplus \{\beta : \star \to \star \} \vdash A' \rhd_{\beta \tau'} \tau'''$ we can conclude $\Delta \vdash A' \rhd_{(\lambda \alpha : \star, \tau)\tau'} \tau''' \{\lambda \alpha : \star \tau / \beta \}$. By β -equivalence (tp_eq_abs_beta) we have that $\Delta \vdash (\lambda \alpha : \star \tau)\tau' \equiv_{\beta \eta} \tau : \star$. From Lemma C.11 (type encoding total and decidable) on $\Delta \vdash \tau : \star$ that $\Delta \vdash A' \rhd_{\tau'} \tau_2$. Using Lemma C.14 (encoding under congruent worlds) on $\Delta \vdash A' \rhd_{(\lambda\alpha; \star, \tau)\tau'} \tau_A'''\{\lambda\alpha: \star, \tau/\beta\}$ and $\Delta \vdash A' \rhd_\tau \tau_2$ and $\Delta \vdash (\lambda\alpha: \star, \tau)\tau' \equiv \beta_\eta \tau : \star$ we can conclude $\Delta \vdash \tau_A'''\{\lambda\alpha: \star, \tau/\beta\} \equiv \beta_\eta \tau_2 : \star$.
 - By inversion on $\Delta \vdash \forall \beta : \star \to \star \tau_A' \equiv \beta_\eta \ \forall \beta : \star \to \star \tau_A'' : \star$ we have that $\Delta \uplus \{\beta : \star \to \star\} \vdash \tau_A' \equiv \beta_\eta \ \tau_A'' : \star$. Using this congruence with type equivalence for substitution (tp_eq_subst) and $\Delta \vdash \tau_1 \equiv_{\beta\eta} \lambda\alpha : \star .\tau : \star \to \star$ we can conclude
 - $\Delta \vdash \tau'_A\{\tau_1/\beta\} \equiv_{\beta\eta} \tau''_A\{\lambda\alpha : \star \tau/\beta\} : \star. \text{ By transitivity of type congruence (tp-eq_trans) on } \\ \Delta \vdash \tau'_A\{\tau_1/\beta\} \equiv_{\beta\eta} \tau''_A\{\lambda\alpha : \star \tau/\beta\} : \star \text{ and } \Delta \vdash \tau''_A\{\lambda\alpha : \star \tau/\beta\} \equiv_{\beta\eta} \tau_2 : \star \text{ and }$ $\Delta \vdash \tau_A \equiv_{\beta\eta} \tau_A' \{\tau_1/\beta\} : \star \text{ we have that } \Delta \vdash \tau_A \equiv_{\beta\eta} \tau_2 : \star.$
- Lemma C.12 (typing encoding with congruent results) on $\Delta \vdash A' \rhd_{\tau} \tau_2$ and $\Delta \vdash A \rhd_{\tau} \tau_A$ with $\Delta \vdash \tau_A \equiv_{\beta\eta} \tau_2 : \star$ we can conclude that A' = A.

$$\frac{\alpha \not \in \Delta \quad \Delta \uplus \{\alpha : \star \to \star\}; \operatorname{dom}(\Omega) \vdash M \rhd_{\alpha \tau} e}{\Delta; \operatorname{dom}(\Omega) \vdash \mathbf{box} M \rhd_{\tau} \Lambda \alpha : \star \to \star . e} \text{ en_box}$$

We have $\Delta \uplus \{\alpha : \star \to \star\} \vdash \Omega \rhd \Gamma_2$ by weakening and $\Delta \uplus \{\alpha : \star \to \star\} \vdash \varnothing \rhd_{\alpha\tau} \varnothing$ by Definition C.1 (environment encoding).

The forward direction follows from straightforward use of induction:

- Using inversion on Ω ; $\Upsilon \vdash \mathbf{box} M : A$ we can conclude Ω ; $\varnothing \vdash M : A'$ where $A = \Box A'$.
- By inversion on $\Delta \vdash \Box A' \rhd_{\tau} \tau_{A}$ we have that $\Delta \uplus \{\alpha : \star \to \star\} \vdash A' \rhd_{\tau} \tau'_{A}$ where
- $\tau_A = \forall \alpha : \star \to \star : \tau'_A$.
- Appealing to the induction hypothesis on $\Delta \uplus \{\alpha : \star \to \star\}; \operatorname{dom}(\Omega) \vdash M \rhd_{\alpha \tau} e$, with the auxilary
 - $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A.$
- Via the typing rule for type abstraction (tp-tabs) and weakening we can conclude $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \Lambda \alpha : \star \to \star .e : \forall \alpha : \star \to \star .\tau'_A.$

27

Backward direction:

- By Lemma C.8 (inversion) on $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \Lambda \alpha : \star \to \star \cdot e : \tau_A$ we can conclude that $\Delta \uplus \{\alpha : \star \to \star \}; \Gamma_1 \uplus \Gamma_2 \vdash e : \tau_A'$ where $\Delta \vdash \tau_A \equiv_{\beta\eta} \forall \alpha : \star \to \star \cdot \tau_A'$.
- From Lemma C.10 (inversion) on $\Delta \vdash A \rhd_{\tau} \tau_A$ and $\Delta \vdash \tau_A \equiv_{\beta\eta} \forall \alpha : \star \to \star : \tau'_A :$ can conclude $\Delta \uplus \{\alpha : \star \to \star\} \vdash A' \rhd_{\alpha\tau} \tau'_A \text{ where } A = \Box A'.$
- Given that $\alpha \notin \Delta$ and $\Delta \vdash \tau : \star$, we know that $\alpha \notin FTV(\tau)$. Using Lemma C.3 (local

 $\Delta \uplus \{\alpha : \star \to \star\}; \operatorname{dom}(\Omega) \vdash M \rhd_{\alpha\tau} e \text{ and } \Delta \uplus \{\alpha : \star \to \star\}; \Gamma_1 \uplus \Gamma_2 \vdash e : \tau_A' \text{ and }$ $\Delta \oplus \{\alpha : \star \to \star\} \vdash A' \rhd_{\alpha\tau} \tau'_A \text{ we can conclude } \Delta \oplus \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A.$ strengthening) on $\Delta \vdash \Upsilon \rhd_{\tau} \Gamma_1$ and $\Delta \uplus \{\alpha : \star \to \star\} \vdash \Omega \rhd \Gamma_2$ and

- By appealing to the induction hypothesis on $\Delta \uplus \{\alpha : \star \to \star\} \vdash A' \rhd_{\alpha\tau} \tau'_A$, with the auxiliary $\Delta \in \{\alpha : \star \to \star\}; \operatorname{dom}(\Omega) \vdash M \rhd_{\alpha \tau} e \text{ and } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash e : \tau'_A \text{ we have a derviation } \Delta \in \{\alpha : \star \to \star\}; \Gamma_2 \vdash$ judgements $\Delta \uplus \{\alpha : \star \to \star\} \vdash \varnothing \rhd_{\alpha\tau} \varnothing$ and $\Delta \uplus \{\alpha : \star \to \star\} \vdash \Omega \rhd \Gamma_2$ and
- Using the typing rule for box (tp-box) on Ω ; $\varnothing \vdash M : A'$ we can conclude Ω ; $\Upsilon \vdash M : \Box A'$.

Case

$$\overline{\Delta;\mathrm{dom}(\Omega) \vdash \langle\rangle \rhd_\tau \left\langle\rangle[\tau]} \text{ en_unit }$$

Forward direction

- Using the type application rule (tp-tapp) we have that $\Delta; \Gamma_1 \oplus \Gamma_2 \vdash \langle \rangle[\tau] : \overline{1}(\alpha)\{\tau/\alpha\}$. Which by substitution is the same as $\Delta; \Gamma_1 \oplus \Gamma_2 \vdash \langle \rangle[\tau] : 1(\tau)$. By the unit typing rule (tp_unit) and weakening we can conclude Δ ; $\Gamma_1 \uplus \Gamma_2 \vdash \langle \rangle : \forall \alpha : \star .1(\alpha)$.
- From inversion on Ω ; $\Upsilon \vdash \langle \rangle : A$ we know that A = 1, so by inversion on $\Delta \vdash 1 \rhd_{\tau} \tau_{A}$ we know that $\tau_A = 1(\tau)$.

Backward direction:

- We can trivially conclude by the axioms for unit (tp_unit and en_tp_unit) that Ω ; $T \vdash \langle \rangle : 1$ and $\Delta \vdash 1 \rhd_{\tau} 1(\tau)$.

Case

$$\begin{array}{ll} \Delta; \mathrm{dom}(\Omega) \vdash M \rhd_{\tau} e & \Delta \vdash A_1 \rhd_{\tau} \tau_1 \\ \Delta; \mathrm{dom}(\Omega) \vdash \lambda x : A_1.M \rhd_{\tau} \lambda x : \tau_1.e \end{array} \text{ en abs}$$

Common:

- Using Definition C.1 (environment encoding) on $\Delta \vdash \Upsilon \rhd_{\tau} \Gamma_1$ and $\Delta \vdash A_1 \rhd_{\tau} \tau_1$ we can conclude $\Delta \vdash \Upsilon \uplus \{x : A_1\} \rhd_{\tau} \Gamma_1 \uplus \{x : \tau_1\}.$
- The forward direction follows from straightforward use of induction:
- By inversion on Ω ; $\Upsilon \vdash \lambda x : A_1.M : A$ we know that $A = A_1 \to A_2$ and that
- Ω ; Y \uplus $\{x: A_1\} \vdash M: A_2$.

We know that $\Delta \vdash A_1 \rhd_{\tau} \tau_1$ therefore we can conclude $\Delta \vdash \Upsilon \uplus \{x : A_1\} \rhd_{\tau} \Gamma_1 \uplus \{\tau_1\}$.

- From inversion $\Delta \vdash A_1 \to A_2 \rhd_{\tau} \tau_A$ we know that $\Delta \vdash A_1 \rhd_{\tau} \tau_1'$ and $\Delta \vdash A_2 \rhd_{\tau} \tau_2$ where
- $\tau_A = \tau_1' \to \tau_2$. Using Lemma C.13 (uniqueness of type encoding) on $\Delta \vdash A_1 \rhd_\tau \tau_1'$ and $\Delta \vdash A_1 \rhd_{\tau} \tau_1$ we can conclude we have $\tau_1 = \tau'_1$.
- By application of the induction hypothesis to Δ ; dom $(\Omega) \vdash M \rhd_{\tau} e$, with the following auxiliary
- judgements $\Delta \vdash \Upsilon \uplus \{x : A_1\} \rhd_{\tau} \Gamma_1 \uplus \{\tau_1\}$ and $\Delta \vdash \Omega \rhd \Gamma_2$ and $\Delta \vdash A_2 \rhd_{\tau} \tau_2$ and Ω ; $\Upsilon \cup \{x : A_1\} \vdash M : A_2$, we have that Δ ; $\Gamma_1 \cup \{x : \tau_1\} \cup \Gamma_2 \vdash e : \tau_2$.
- By the typing rule for abstraction (tp_abs) on $\Delta; \Gamma_1 \uplus \{x: \tau_{A_1}\} \uplus \Gamma_2 \vdash e: \tau_2$ we can conclude $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \lambda x : \tau_1.e : \tau_1 \to \tau_2.$
- Backward direction:
- From Lemma C.8 (inversion) on $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \lambda x : \tau_1 . e : \tau_A$ we know that
- $\Delta; \Gamma_1 \uplus \Gamma_2 \uplus \{x : \tau_1\} \vdash e : \tau_2 \text{ where } \Delta \vdash \tau_A \equiv_{\beta\eta} \tau_1 \rightarrow \tau_2 : \star.$
- From Lemma C.10 (inversion) on $\Delta \vdash A \rhd_{\tau} \tau_A$ and $\Delta \vdash A_1 \rhd_{\tau} \tau_1$ and $\Delta \vdash \tau_A \equiv_{\beta\eta} \tau_1 \to \tau_2 : \star$ we
 - Appealing to the induction hypothesis on Δ ; dom $(\Omega) \vdash M \rhd_{\tau} e$, with the auxiliary judgements $\Delta \vdash \Upsilon \uplus \{x:A_1\} \rhd_\tau \Gamma_1 \uplus \{x:\tau_1\} \text{ and } \Delta \vdash \Omega \rhd \Gamma_2 \text{ and } \Delta \vdash A_2 \rhd_\tau \tau_2 \text{ and } \Delta ; \Gamma_1 \uplus \Gamma_2 \uplus \{x:\tau_1\} \vdash e:\tau_2 \text{ we have a derivation } \Omega; \Upsilon \uplus \{x:A_1\} \vdash M:A_2.$ know that $\Delta \vdash A_2 \rhd_{\tau} \tau_2$ where $A = A_1 \to A_2$.

Using the typing rule for abstraction (tp_abs) on Ω ; $\Upsilon \cup \{x: A_1\} \vdash M: A_2$ we have Ω ; $\Upsilon \vdash \lambda x : A_1.M : A_1 \to A_2$.

Case

$$\Sigma(c) = B \to b \quad \Delta \vdash B \rhd_{\tau} \tau_{B}$$

 $\Delta; \mathrm{dom}(\Omega) \vdash c \, \overline{\triangleright_{\tau} \, \lambda x} : \tau_{B}.\mathbf{roll}[\tau](\mathbf{inj}_{\mathcal{L}(c)} \, x \, \mathbf{of} \, \Sigma^*(\mathsf{Rec} \, \Sigma^* \, \tau)) \, \xrightarrow{\mathsf{en_con}}$

Common:

- By Lemma C.16 (commutivity of parameterization and type encoding) on $\Delta \vdash B \vdash_{\tau} \tau_B$ we know that $\tau_B = (\text{Rec } \Sigma^* \ \tau) \langle B \rangle$.
 - By Lemma C.7 (well-formedness of type encoding) we can conclude $\Delta \vdash \{x : \tau_B\}$. Using this fact, the variable typing rule (tp-var), the injection typing rule (tp-variant), and signature encoding (en_sig), $\tau_B = (\text{Rec } \Sigma^* \tau) \langle B \rangle$, and type equivalence we can conclude that $\Delta; \{x: \tau_B\} \vdash \mathbf{inj}_{\mathcal{L}(c)} \, x \, \mathbf{of} \, \Sigma^*(\mathsf{Rec} \, \Sigma^* \, \tau)) : \Sigma^*(\mathsf{Rec} \, \Sigma^* \, \tau).$
- using the type application rule (tp-tapp), weakening, the typing rule for applications (tp-app), By Lemma C.18 (roll typing) we know that $\varnothing: \varnothing \vdash \text{roll} : \forall \alpha.\Sigma^*(\text{Rec }\Sigma^* \ \alpha) \to \text{Rec }\Sigma^* \ \alpha$. By and finally the abstraction typing rule (tp_abs) along with weakening we can conclude $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \lambda x : \tau_B.\mathbf{roll}[\tau](\mathbf{inj}_{\mathcal{L}(c)} \, x \, \mathbf{of} \, \Sigma^*(\mathsf{Rec} \, \Sigma^* \, \tau)) : \tau_B \to \mathsf{Rec} \, \Sigma^* \, \tau.$

Forward direction

From inversion on Ω ; $\Upsilon \vdash c : A$, we know that $\Sigma(c) = B \to b$ and $A = B \to b$. By inversion on $\Delta \vdash B \to b \rhd_{\tau} \tau_{A}$ we know that $\Delta \vdash B \rhd_{\tau} \tau'_{B}$ and $\Delta \vdash b \rhd_{\tau} \tau'_{b}$ where $\tau_{A} = \tau'_{B} \to \tau'_{\tau}$. Using Lemma C.13 (uniqueness of type encoding) on $\Delta \vdash B \rhd_{\tau} \tau'_{B}$ and $\Delta \vdash B \rhd_{\tau} \tau_{B}$ we have that $\tau_B = \tau_B'$. Finally, by inversion on $\Delta \vdash b \rhd_\tau \tau_b'$ we have that $\tau_b' = \text{Rec } \Sigma^* \tau$. Therefore, $\Delta \vdash A \rhd_{\tau} \tau_B \to \text{Rec } \Sigma^* \tau.$

Backward direction:

- From $\Sigma(c) = B \to b$ and the typing rule for constants (tp_con) we can conclude Ω ; $\Upsilon \vdash c : B \to b$.

By using the rule for encoding functions (en_tp_arrow) on $\Delta \vdash B \rhd_{\tau} \tau_B$ and the axiom $\Delta \vdash b \rhd_{\tau} \operatorname{Rec} \Sigma^* \tau \text{ (en_tp_b) we can conclude } \Delta \vdash B \to b \rhd_{\tau} \tau_B \to \operatorname{Rec} \Sigma^* \tau.$

7

$$\frac{\Delta \vdash A \rhd_{\tau} \tau_{A} \quad \Delta; \operatorname{dom}(\Omega) \vdash \Theta \rhd_{\tau^{A}}^{\tau_{A}} e_{\Theta} \quad \Delta; \operatorname{dom}(\Omega) \vdash M \rhd_{\tau} e_{M}}{\Delta; \operatorname{dom}(\Omega) \vdash \operatorname{iter} [\Box B, A][\Theta] \ M \rhd_{\tau} \operatorname{iter} \{B^{*}\}[\tau][\tau_{A}] e_{\Theta} e_{M}} \text{ en_iter}$$

Common

- Lemma C.11 (type encodings is total and decidable) tells us that for $\Box B$ and $\Delta \vdash \tau : \star$ we can construct a derivation $\Delta \vdash \Box B \rhd_{\tau} \tau_B$.

- $\Delta \uplus \{\beta : \star \to \star\} \vdash B \rhd_{\beta\tau} \tau'_B$. By Lemma C.16 (commutivity of parameterization and type – By inversion on $\Delta \vdash \Box B \rhd_{\tau} \tau_{B}$ we know that $\tau_{B} = \forall \beta : \star \to \star .\tau'_{B}$ and encoding) we know that $\tau_B' = (\text{Rec } \Sigma^* \ \beta \tau) \langle B \rangle$.
- By Lemma C.17 (commutivity of iteration types and type encoding) on $\Delta \vdash A \rhd_{\tau} \tau_A$ we have that $\Delta \vdash A\langle B \rangle \rhd_{\tau} \tau_{A}\langle B \rangle$.

The forward direction follows from straightforward use of induction:

- By inversion on Ω ; $\Upsilon \vdash \mathbf{iter} [\Box B, A][\Theta] M : A'$ we know that $A' = A\langle B \rangle$ and Ω ; $\Upsilon \vdash \Theta : A\langle \Sigma \rangle$ and Ω ; $\Upsilon \vdash M : \Box B$.
- By appealing to the induction hypothesis on Δ ; dom $(\Omega) \vdash M \rhd_{\tau} e_{M}$, with the expected auxiliary judgements, we have Δ ; $\Gamma_1 \uplus \Gamma_2 \vdash e_{M} : \forall \beta : \star \to \star . \text{Rec } \Sigma^* \ \beta \tau \langle B \rangle$ From this derivation, beta-equivalence (tp_eq_abs_beta), and type equivalence (tp_eq) we can derive
 - $\Delta : \Gamma_1 \oplus \Gamma_2 \vdash e_M : \forall \beta : \star \to \star .B^*(\mathsf{Rec}\ \Sigma^* \ \beta \tau).$
- By appealing to the induction hypothesis on Δ ; dom $(\Omega) \vdash \Theta \rhd_{\tau^A}^{\tau_A} e_{\Theta}$, with the expected auxiliary judgements, we can conclude that $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e_{\Theta} : \Sigma^* \tau_A \to \tau_A$.

 $\varnothing; \varnothing \vdash \mathbf{iter} \{ B^* \} : \forall \gamma : \star \cdot \forall \alpha : \star \cdot (\Sigma^* \alpha \to \alpha) \to (\forall \beta : \star \to \star \cdot B^* (\mathsf{Rec} \ \Sigma^* \ \beta \gamma)) \to B^* \alpha. \text{ Using type}$ application (tp_tapp), weakening, the application typing rule (tp_app) twice, and type equivalence we can conclude Δ , $\Gamma_1 \uplus \Gamma_2 \vdash \mathbf{iter} \{B^*\}[\tau][\tau_A] \ e_{\Theta} \ e_M : \tau_A \langle B \rangle$. By Lemma C.19 (iter typing) we know that

Backward direction:

- repeated use of Lemma C.8 (inversion) on $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{iter}[B^*][\tau][\tau_A] \overset{\circ}{\epsilon}_{\Theta} e_M : \tau_A'$, followed by type equivalence (tp_eq) we can conclude that $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e_M : \forall \beta : \star \to \star .B^*(Rec \Sigma^* \beta \tau)$ and By Lemma C.19 (iter typing) we know that $\Delta; \Gamma_1 \oplus \Gamma_2 \vdash e_{\Theta} : \Sigma^* \tau_A \to \tau_A$.
- Using the induction hypothesis on Δ ; dom $(\Omega) \vdash M \rhd_{\tau} e_M$, with the expected auxiliary judgements, we can conclude Ω ; $\Upsilon \vdash M : \Box B$.
- Appealing to the induction hypothesis on Δ ; dom $(\Omega) \vdash \Theta \rhd_{\tau}^{\tau_A} e_{\Theta}$, with the expected auxiliary judgments, gives a derivation Ω ; $\Upsilon \vdash \Theta : A\langle \Sigma \rangle$.
- Using the iteration typing rule (tp_iter) on $\Omega; \Upsilon \vdash M : \Box B$ and $\Omega; \Upsilon \vdash \Theta : A\langle \Sigma \rangle$ we know that Ω ; $\Upsilon \vdash \mathbf{iter} [\Box B, A][\Theta] \ M : A\langle B \rangle$.

Case

$$\begin{array}{l} \Delta \vdash \Box A_1 \rhd_\tau \tau_1 \\ \Delta ; \mathrm{dom}(\Omega) \vdash M_1 \rhd_\tau e_1 \quad \Delta ; \mathrm{dom}(\Omega) \uplus \{x\} \vdash M_2 \rhd_\tau e_2 \\ \overline{\Delta ; \mathrm{dom}(\Omega) \vdash \mathbf{let\ box}\ x : A_1 = M_1 \mathbf{in}\ M_2 \rhd_\tau (\lambda x : \tau_1 \cdot e_2) e_1} \ \mathrm{en_letb} \end{array}$$

Common:

– Given that $\Delta \vdash \Box A_1 \rhd_{\tau} \tau_1$, using Definition C.1 (environment encoding), we have that $\Delta \vdash \Omega \uplus \{x : A_1\} \rhd \Gamma_2 \uplus \{x : \tau_1\}.$ From inversion on Ω ; $\Upsilon \vdash \mathbf{let}$ box $x : A_1 = M_1$ in $M_2 : A$ we can conclude Ω ; $\Upsilon \vdash M_1 : \square A_1$ and

The forward direction follows by straightforward use of induction:

- $\Omega \oplus \{x: A_1\}; \Upsilon \vdash M_2: A.$
 - Appealing to the induction hypothesis on Δ ; dom $(\Omega) \vdash M_1 \rhd_{\tau} e_1$, and the expected auxiliary
 - Appealing to the induction hypothesis on Δ ; dom $(\Omega) \uplus \{x\} \vdash M_2 \rhd_{\tau} e_2$, with the auxiliary judgements $\Delta \vdash \Upsilon \rhd_{\tau} \Gamma_1$ and $\Delta \vdash \Omega \uplus \{x : A_1\} \rhd \Gamma_2 \uplus \{x : \tau_1\}$ and $\Delta \vdash A \rhd_{\tau} \tau_A$ and judgements, we have that $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e_1 : \tau_1$.
 - $\Omega \cup \{x: A_1\}; \Upsilon \vdash M_2: A$, we can produce a derivation $\Delta; \Gamma_1 \cup \Gamma_2 \cup \{x: \tau_1\} \vdash e_2: \tau_A$. Using the typing rules for abstraction (tp_abs) and application (tp_app) on
- $\Delta; \Gamma_1 \uplus \Gamma_2 \uplus \{x : \tau_1\} \vdash e_2 : \tau_A \text{ and } \Delta; \Gamma_1 \uplus \Gamma_2 \vdash e_1 : \tau_1 \text{ we can conclude the desired result}$ $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash (\lambda x : \tau_1.e_2)e_1 : \tau_A.$

- By repeated use of Lemma C.8 (inversion) on $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash (\lambda x : \tau_1.e_2)e_1 : \tau_A$ we have that $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e_1 : \tau'_1 \text{ and } \Delta; \Gamma_1 \uplus \Gamma_2 \uplus \{x : \tau_1\} \vdash e_2 : \tau' \text{ where } \Delta \vdash \tau_A \equiv_{\beta\eta} \tau_2 : \star \text{ and }$
- By inversion on $\Delta \vdash \tau_1' \to \tau' \equiv_{\beta\eta} \tau_1 \to \tau_2 : \star$ we can conclude $\Delta \vdash \tau_1' \equiv_{\beta\eta} \tau_1 : \star$. Therefore, we have $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e_1 : \tau_1'$ by type equivalence (tp_eq). Similarly for $\Delta; \Gamma_1 \uplus \Gamma_2 \uplus \{x : \tau_1\} \vdash e_2 : \tau_A.$ $\Delta \vdash \tau_1' \to \tau' \equiv_{\beta\eta} \tau_1 \to \tau_2 : \star.$
- Using the induction hypothesis on Δ ; dom $(\Omega) \vdash M_1 \rhd_{\tau} e_1$, with the expected auxiliary
- Again using the induction hypothesis on Δ ; dom $(\Omega) \uplus \{x\} \vdash M_2 \rhd_{\tau} e_2$, with the auxiliary judgements, we can conclude that Ω ; $\Upsilon \vdash M_1 : \Box A_1$.
- judgements $\Delta \vdash \Upsilon \rhd_{\tau} \Gamma_1$ and $\Delta \vdash \Omega \uplus \{x : A_1\} \rhd \Gamma_2 \uplus \{x : \tau_1\}$ and $\Delta \vdash A \rhd_{\tau} \tau_A$ and $\Delta ; \Gamma_1 \uplus \Gamma_2 \uplus \{x : \tau_1\} \vdash e_2 : \tau_A$, we have that $\Omega \uplus \{x : A_1\}; \Upsilon \vdash M_2 : A$.
- By using the typing rule for letbox (tp_letb) on Ω ; $\Upsilon \vdash M_1 : \Box A_1$ and $\Omega \uplus \{x : A_1\}$; $\Upsilon \vdash M_2 : A_1$

we have the desired result Ω ; $\Upsilon \vdash \mathbf{let}$ box $x : A_1 = M_1$ in $M_2 : A$.

Cases The remaining cases procedure by straightforward application of the induction hypothesis and inversion to the subderivations.

The case for Δ ; dom $(\Omega) \vdash \Theta \rhd_{\tau}^{\tau_A} e_{\Theta}$

č.

$$\frac{\forall c_i \in \mathrm{dom}(\Theta) \quad \Delta; \mathrm{dom}(\Omega) \vdash \Theta(c_i) \rhd_\tau e_i}{\Delta; \mathrm{dom}(\Omega) \vdash \Theta \rhd_\tau^{\tau_A} \lambda x : \Sigma^* \tau_A.\mathbf{case} \ x \ \mathbf{ofinj}_{\mathcal{L}(c_1)} \ y_1 \ \mathbf{in} \ (e_1 y_1)} \ \mathbf{en_rep}$$

 $\mathbf{inj}_{\mathcal{L}(c_n)} y_n \mathbf{in} (e_n y_n)$

Commo

 $\Delta \vdash A\langle B_i \to b \rangle \rhd_{\tau} \tau_i$ for each B_i , where $\Sigma(c_i) = B_i \to b$. From the definition of iteration types, $\Delta \vdash A\langle B_i \rangle \rhd_{\tau} \tau_i'$ and $\Delta \vdash A \rhd_{\tau} \tau_A'$ where $\tau_i = \tau_i' \to \tau_A'$. Lemma C.13 (uniqueness of type encoding) on $\Delta \vdash A \rhd_{\tau} \tau_A'$ and $\Delta \vdash A \rhd_{\tau} \tau_A$ tells us that $\tau_A = \tau_A'$. $A\langle B_i \to b \rangle = A\langle B_i \rangle \to A$. Therefore by inversion on $\Delta \vdash A\langle B_i \rangle \to A \rhd_{\tau} \tau_i$ we know that Lemma C.11 (type encoding total and decidable) on tells us that we can construct

The forward direction follows by straightforward use of the induction:

- Using inversion on Ω ; $\Upsilon \vdash \Theta : A(\Sigma)$ we can conclude for all $c_i \in \text{dom}(\Sigma)$ that $\Omega; \Upsilon \vdash \Theta(c_i) : A\langle B_i \to b \rangle \text{ where } \Sigma(c_i) = B_i \to b.$
- Appealing to the induction hypothesis on Δ ; dom $(\Omega) \vdash \Theta(c_i) \rhd_{\tau} e_i$, with the auxiliary judgements $\Delta \vdash \Upsilon \rhd_{\tau} \Gamma_1$ and $\Delta \vdash \Omega \rhd \Gamma_2$ and $\Delta \vdash A \langle B_i \to b \rangle \rhd_{\tau} \tau_i$ and and Ω ; $\Upsilon \vdash \Theta(c_i) : A\langle B_i \to b \rangle$, we have that Δ ; $\Gamma_1 \uplus \Gamma_2 \vdash e_i : \tau_i' \to \tau_A$.
- Using the type typing rule for variables (tp-var) and application (tp-app) for each y_i and e_i , $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \lambda x : \Sigma^* \tau_A.\mathbf{case} \ x \ \mathbf{ofinj}_{\mathcal{L}(c_1)} \ y_1 \ \mathbf{in} \left(e_1 y_1 \right) \ \dots \ \mathbf{inj}_{\mathcal{L}(c_n)} \ y_n \ \mathbf{in} \left(e_n y_n \right) : \Sigma^* \tau_A \to \tau_A.$ followed by typing rule for case (tp_case) and abstraction (tp_abs) allows us to conclude

Backward direction:

- From repeated use of Lemma C.8 (inversion) on

$$\Delta \uplus \{\alpha: \star \to \star\}; \Gamma \uplus \Gamma_1 \uplus \ldots \uplus \Gamma_n \uplus \Gamma' \vdash \lambda x : \Sigma^* \tau_A.\mathbf{case} \ x \ \mathbf{ofinj}_{\mathcal{L}(c_1)} \ y_1 \ \mathbf{in} \ (e_1 y_1) \ \ldots \ \mathbf{inj}_{\mathcal{L}(c_n)} \ y_n \ \mathbf{in} \ (e_n y_n) : \Sigma^* \tau_A \to \tau_A$$

 $\text{conclude } \Delta \uplus \{\alpha: \star \to \star\}; \Gamma \uplus \Gamma_1 \uplus \ldots \uplus \Gamma_n \uplus \Gamma' \uplus \{x: \Sigma^*\tau_A\} \uplus \{y_i: \tau_A \langle B_i \rangle\} \vdash e_i: \tau_A \langle B_i \rangle \to \tau_A,$ along with transitivity on type congruences (tp_eq_trans) and type equivalence (tp_eq) we can

- We know that x and each y_i appears fresh in the final translation derivation, therefore we know that for each e_i , we can strengthen the typing derivations to $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e_i : \tau_A \langle B_i \rangle \to \tau_A$, which by the definition of parameterization is the same as Δ ; $\Gamma_1 \uplus \Gamma_2 \vdash e_i : \tau_A \langle B_i \to b \rangle$.
- Appealing to the induction hypothesis on $\Delta; \text{dom}(\Omega) \vdash \Theta(c_i) \rhd_{\tau} e_i$, with the auxiliary Δ ; $\Gamma_1 \uplus \Gamma_2 \vdash e_i : \tau_A \langle B_i \to b \rangle$, gives us that Ω ; $\Upsilon \vdash \Theta(c_i) : A \langle B_i \to b \rangle$ for each e_i . judgements $\Delta \vdash \Upsilon \rhd_{\tau} \Gamma_1$ and $\Delta \vdash \Omega \rhd \Gamma_2$ and $\Delta \vdash A\langle B_i \to b \rangle \rhd_{\tau} \tau_i$ and
- Applying the typing rule for replacements (tp-rep) to each Ω ; $\Upsilon \vdash \Theta(c_i) : A\langle B_i \to b \rangle$ licenses us to conclude Ω ; $\Upsilon \vdash \Theta : A\langle \Sigma \rangle$.

An important lemma is required for **box**ed terms in the backward direction. To show that the **box**ed term is well-typed in the source language, we need to show that the local environment is empty.

world containing a type variable α , if the local environment is encoded with respect to a world that does We use the following lemma to do so, which guarantees that if the term is encoded with respect to some not contain the type variable α , then those bindings must be unnecessary for the typing derivation.

Lemma C.3 (Local strengthening). Assume $\Delta \uplus \{\alpha : \star \to \star\} \vdash \Omega \rhd \Gamma_1 \text{ and } \Delta \vdash \Gamma \rhd_\tau \Gamma_2 \text{ and } A \vDash \Gamma \rhd_\tau \Gamma_2 \text{ ord } A \vDash \Gamma \simeq \Gamma \simeq \Gamma_2 \text{ ord } A \vDash \Gamma \simeq \Gamma_2 \text{ ord } A \vDash \Gamma \simeq \Gamma_2 \text{ ord } A \simeq \Gamma \simeq \Gamma_2 \text{ ord } A \simeq \Gamma_2 \text{ ord$ $\alpha \not \in \mathrm{FTV}(\tau). \ \ I \!\!\!\! f \Delta \uplus \{\alpha : \star \to \star\}; \mathrm{dom}(\Omega) \vdash M \rhd_{\alpha \tau} e \ and \ \Delta \uplus \{\alpha : \star \to \star\}; \Gamma_1 \uplus \Gamma_2 \vdash e : \tau' \ \ where$

$$\Delta \uplus \{\alpha : \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau' \text{ then } \Delta \uplus \{\alpha : \star \to \star\}; \Gamma_1 \vdash e : \tau'$$

Proof. We cannot prove this lemma directly, but must instead generalize the induction hypothesis, yielding the next Lemma C.4 (superflous context elimination). It then follows by instantiating Lemma C.4 with $\Upsilon_i \in \{\Upsilon\} \text{ and } \Upsilon = \varnothing$

Lemma C.4 (Superflous context elimination).

- $\Delta \uplus \{\alpha : \star \to \star\} : \Gamma \uplus \Gamma_1 \uplus ... \uplus \Gamma_n \check{\uplus} \Gamma' \vdash e : \check{\tau'} \text{ where } \Delta \uplus \{\alpha : \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau' \text{ then }$ 1. If $\Delta \uplus \{\alpha : \star \to \star\}$; dom $(\Omega) \vdash M \rhd_{\alpha\tau} e$ and $\Delta \vdash \Upsilon_i \rhd_{\tau_i} \Gamma_i$ and $\alpha \not\in FTV(\Gamma_i)$ and $\Delta \uplus \{\alpha : \star \to \star\} \vdash \Omega \rhd \Gamma \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \to \{\alpha : \star \to \star\} \vdash \Upsilon \to \{\alpha : \star \to \star\} \to \{\alpha : \star \to \star\} \vdash \Upsilon \to \{\alpha : \star \to \star\} \to \{\alpha : \star \to$ $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma' \vdash e : \tau'.$
- $\Delta \uplus \{\alpha: \star \to \star\} ; \Gamma \uplus \Gamma_1 \uplus \ldots \uplus \Gamma_n \overset{.}{\uplus} \Gamma' \vdash e_{\Theta} : \overset{.}{\Sigma}^{*}\tau_A \to \tau_A \text{ where } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \to \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \to \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \to \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \to \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \to \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \to \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \to \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \to \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \to \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \to \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \to \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A \text{ then } \Delta \to \{\alpha: \star \to \star\} \vdash A \to \{\alpha:$ 2. If $\Delta \uplus \{\alpha : \star \to \star\}; \operatorname{dom}(\Omega) \vdash \Theta \rhd_{\alpha\tau}^{\tau_A} \in_{\Theta} \text{ and } \Delta \vdash \Upsilon_i \rhd_{\tau_i} \Gamma_i \text{ and } \alpha \notin \operatorname{FTV}(\Gamma_i) \text{ and } d \in \operatorname{FTV}(\Gamma_i) \text{ and }$ $\Delta \uplus \{\alpha : \star \to \star\} \vdash \Omega \rhd \Gamma \text{ and } \Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and }$ $\uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma' \vdash e_{\Theta} : \Sigma^* \tau_A \to \tau_A.$

Proof. By mutual induction over the structure of $\Delta \uplus \{\alpha : \star \to \star\}$; dom $(\Omega) \vdash M \rhd_{\alpha \tau} e$ and $\Delta \uplus \{\alpha : \star \to \star\}; \operatorname{dom}(\Omega) \vdash \Theta \rhd_{\alpha\tau}^{\tau_A} e_{\Theta}$. The cases for the former:

$$\frac{x \notin \mathrm{dom}(\Omega)}{\Delta \uplus \{\alpha : \star \to \star\}; \mathrm{dom}(\Omega) \vdash x \rhd_{\alpha\tau} x} \text{ en_V6}$$

 $\Delta \uplus \{\alpha : \star \to \star\} \vdash \tau' \equiv_{\beta\eta} \tau'' : \star$. By the fact that $x \not\in \text{dom}(\Omega)$ and Definition C.1 (environment – By assumption we have that $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma_1 \uplus \ldots \uplus \Gamma_n \uplus \Gamma' \vdash x : \tau'$. Therefore by Lemma C.8 (inversion), we can conclude that $(x:\tau''\in\Gamma\uplus\Gamma_1\uplus\ldots\uplus\Gamma_n\uplus\Gamma',$ where encoding) we know that $x \not\in \text{dom}(\Gamma)$. Futhermore that $x : \tau'' \in \Gamma_1 \cup \ldots \cup \Gamma_n \cup \Gamma'$

that $\alpha \notin FTV(\Gamma_i)$, so $x:\tau''$ cannot be in Γ_i and it must be the case that $x:\tau'' \in \Gamma'$. Therefore, we are may conclude $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma' \vdash x : \tau'$ by the variable typing rule (tp_var) followed Given that the contexts are disjoint $x: \tau'' \in \Gamma_i$ or $x: \tau'' \in \Gamma'$. Assume $x: \tau'' \in \Gamma_i$. By Lemma $\Delta \uplus \{\alpha : \star \to \star\} \vdash \tau' \equiv_{\beta\eta} \tau'' : \star \text{ so we know that } \mathrm{FTV}(\tau') = \mathrm{FTV}(\tau'').$ However, we assumed C.21 (type containment) on $\Delta \uplus \{\alpha : \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau'$ we know that $FTV(\alpha\tau) = FTV(\tau')$. by type equivalence (tp_eq).

$_{\rm Case}$

$$x\in\mathrm{dom}(\Omega)$$

$$\Delta \uplus \{\alpha:\star\to\star\};\mathrm{dom}(\Omega)\vdash x\rhd_\tau x[\lambda\alpha:\star,\tau] \ \text{en_bvar}$$

- By assumption we have that $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma_1 \uplus \ldots \uplus \Gamma_n \uplus \Gamma' \vdash x : \tau'$. Therefore by Lemma C.8 (inversion), we can conclude that $x:\tau''\in\Gamma\cup\Gamma_1\cup\ldots\cup\Gamma_n\cup\Gamma'$ where $\Delta \uplus \{\alpha : \star \to \star\} \vdash \tau' \equiv_{\beta\eta} \tau'' : \star.$
- However, we know that $x \in \text{dom}(\Omega)$ which means by Definition C.1 (environment encoding) that $x:\tau''\in\Gamma\uplus\Gamma'$, by which by the variable typing rule (tp_var) and type equivalence (tp_eq) we $x \in \text{dom}(\Gamma)$. Because the union of contexts must be disjoint, we are allowed to conclude have $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma' \vdash x : \tau'$.

Case

$$\frac{\beta \not\in \Delta \quad \Delta \uplus \{\alpha: \star \to \star\} \uplus \{\beta: \star \to \star\}; \operatorname{dom}(\Omega) \vdash M \rhd_{\beta(\alpha\tau)} e}{\Delta \uplus \{\alpha: \star \to \star\}; \operatorname{dom}(\Omega) \vdash \operatorname{box} M \rhd_{\alpha\tau} \Lambda \beta: \star \to \star.e} \text{ en box }$$

By inversion on $\Delta \in \{\alpha : \star \to \star\}; \Gamma \in \Gamma_1 \cup \ldots \cup \Gamma_n \cup \Gamma' \vdash \Lambda\beta : \star \to \star .e : \tau' \text{ we know that }$ $\begin{array}{l} \Delta \uplus \{\alpha: \star \to \star\} \uplus \{\beta: \star \to \star\}; \vec{\Gamma} \uplus \Gamma_1 \uplus \ldots \uplus \Gamma_n \uplus \Gamma' \vdash e: \tau'' \text{ where} \\ \Delta \uplus \{\alpha: \star \to \star\} \vdash \tau' \equiv_{\beta\eta} \forall \beta: \star \to \star\tau'': \star. \end{array}$

 $\Delta \uplus \{\alpha : \star \to \star\} \uplus \{\beta : \star \to \star\} \vdash A' \rhd_{\beta(\alpha\tau)} \tau'_A \text{ where } \Delta \uplus \{\alpha : \star \to \star\} \vdash \tau'_A \equiv_{\beta\eta} \tau'' : \star \text{ and }$ − By Lemma C.10 (inversion) on $\Delta \uplus \{\alpha : \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau'$ and $\Delta \uplus \{\alpha: \star \to \star\} \vdash \tau' \equiv_{\beta\eta} \forall \beta: \star \to \star.\tau'': \star \text{ we can conclude}$

$$A = \Box A'$$
.

- We have $\Delta \uplus \{\alpha : \star \to \star\} \uplus \{\beta : \star \to \star\} \vdash \Omega \rhd \Gamma$ by weakening and
- $\Delta \oplus \{\alpha : \star \to \star\} \oplus \{\beta : \star \to \star\} \vdash \varnothing \rhd_{\beta(\alpha\tau)} \varnothing \text{ by Definition C.1 (environment encoding)}.$
- Using type equivalence (tp_eq) on $\Delta \cup \{\alpha : \star \to \star\} \cup \{\beta : \star \to \star\}$; $\Gamma \cup \Gamma_1 \cup \ldots \cup \Gamma_n \cup \Gamma' \vdash e : \tau''$ and $\Delta \cup \{\alpha : \star \to \star\} \vdash \tau'_A \equiv \beta_n \tau'' : \star$ we have that $\Delta \uplus \{\alpha : \star \to \star\} \uplus \{\beta : \star \to \star\}; \Gamma \uplus \Gamma_1 \uplus \dots \uplus \Gamma_n \uplus \Gamma' \vdash e : \tau'_A$
- By use of the induction hypothesis, with respect to β , on

 $\Delta \uplus \{\alpha : \star \to \star\} \uplus \{\beta : \star \to \star\}; \operatorname{dom}(\Omega) \vdash M \rhd_{\beta(\alpha\tau)} e$, with the auxiliary judgements $\Delta \uplus \{\alpha : \star \to \star\} \vdash \Upsilon_j \rhd_{\tau_j} \Gamma_j$ (where we have added Γ' to the set of contexts to be eliminated)

and $\Delta \uplus \{\alpha : \star \to \star \} \uplus \{\beta : \star \to \star \} \vdash \Omega \rhd \Gamma$ and $\Delta \uplus \{\alpha : \star \to \star \} \uplus \{\beta : \star \to \star \} \vdash \varnothing \rhd_{\beta(\alpha\tau)} \varnothing$ and

By the type abstraction typing rule (tp_tabs), weakening, and type equivalence (tp_eq) we have the desired result $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma' \vdash \Lambda \beta : \star \to \star \cdot e : \tau'$.

$$\begin{array}{ccc} \Delta \uplus \{\alpha: \star \to \star\}; \mathrm{dom}(\Omega) \vdash M \rhd_{\alpha\tau} e & \Delta \uplus \{\alpha: \star \to \star\} \vdash A_1 \rhd_{\alpha\tau} \tau_1 \\ & \Delta \uplus \{\alpha: \star \to \star\}; \mathrm{dom}(\Omega) \vdash \lambda x: A_1.M \rhd_{\alpha\tau} \lambda x: \tau_1.e \end{array}$$
 en_abs

- By Lemma C.8 (inversion) on $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma_1 \uplus \ldots \uplus \Gamma_n \uplus \Gamma' \vdash \lambda x : \tau_1 \cdot e : \tau' \text{ we have}$
 - that $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma_1 \uplus \ldots \uplus \Gamma_n \uplus \Gamma' \uplus \{x : \tau_1\} \vdash e : \tau_2 \text{ and that }$ $\Delta \uplus \{\alpha : \star \to \star\} \vdash \tau' \equiv_{\beta\eta} \tau_1 \to \tau_2 : \star.$
- $\Delta \uplus \{\alpha: \star \to \star\} \vdash \tau' \equiv_{\beta\eta} \tau_1 \to \tau_2: \star \text{ and } \Delta \uplus \{\alpha: \star \to \star\} \vdash A_1 \rhd_{\alpha\tau} \tau_1 \text{ we know } A = A_1 \to A_2$ From Lemma C.10 (inversion) on $\Delta \uplus \{\alpha : \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_1 \to \tau_2$ and

and $\Delta \uplus \{\alpha : \star \to \star\} \vdash A_2 \rhd_{\alpha\tau} \tau_2$.

- Therefore by application of the induction hypothesis to $\Delta \uplus \{\alpha : \star \to \star\}; \operatorname{dom}(\Omega) \vdash M \rhd_{\alpha\tau} e$ with the expected auxiliary judgements we can conclude $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma' \uplus \{x : \tau_1\} \vdash e : \tau_2$.
 - Using the abstraction typing rule (tp_abs) and type equivalence (tp_eq) we have the desired result, $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma' \vdash \lambda x : \tau_1.e : \tau'.$

ase

- By Lemma C.8 (inversion) on $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma_1 \uplus \ldots \uplus \Gamma_n \uplus \Gamma' \vdash (\lambda x : \tau_1.e_2)e_1 : \tau' \text{ we}$ $\Delta \uplus \{\alpha: \star \to \star\}; \Gamma \uplus \Gamma_1 \uplus \ldots \uplus \Gamma_n \uplus \Gamma' \vdash e_1: \tau_1 \text{ where } \Delta \uplus \{\alpha: \star \to \star\} \vdash \tau' \equiv \beta_\eta \tau'': \star \text{ and } \Delta \uplus \{\alpha: \star \to \star\} \vdash \tau_1 \to \tau'' \equiv \beta_\eta \tau_1 \to \tau''': \star$ know that $\Delta \uplus \{\alpha: \star \to \star\}; \Gamma \uplus \Gamma_1 \uplus \ldots \uplus \Gamma_n \uplus \Gamma' \uplus \{x: \tau_1\} \vdash e_2: \tau'''$ and
- Given $\Delta \uplus \{\alpha : \star \to \star\} \vdash \Omega \rhd \Gamma$ and $\Delta \uplus \{\alpha : \star \to \star\} \vdash \Box A_1 \rhd_{\alpha\tau} \tau_1$ and Definition C.1 (environment encoding) we know that $\Delta \uplus \{\alpha : \star \to \star\} \vdash \Omega \uplus \{x : A_1\} \rhd \Gamma \uplus \{x : \tau_1\}$.
- $\Delta \uplus \{\alpha : \star \to \star\} \vdash \tau'' \equiv_{\beta\eta} \tau''' : \star$. Using this congruence and type equivalence (tp_eq) we can By inversion on $\Delta \uplus \{\alpha : \star \to \star\} \vdash \tau_1 \to \tau'' \equiv_{\beta\eta} \tau_1 \to \tau''' : \star \text{ we have that}$ conclude on $\Delta \in \{\alpha : \star \rightarrow \star\}$; $\Gamma \uplus \Gamma_1 \uplus \ldots \uplus \Gamma_n \uplus \Gamma' \uplus \{x : \tau_1\} \vdash e_2 : \tau'$.
- By application of the induction hypothesis to $\Delta \in \{\alpha : \star \to \star\}$; dom $(\Omega) \in \{x\} \vdash M_2 \rhd_{\alpha\tau} e_2$, with $\Delta \uplus \{\alpha: \star \to \star\}; \Gamma \uplus \Gamma_1 \uplus \ldots \uplus \Gamma_n \uplus \Gamma' \uplus \{x: \tau_1\} \vdash e_2: \tau' \text{ and } \Delta \uplus \{\alpha: \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau' \text{ we}$ $\Delta \uplus \{\alpha: \star \to \star\} \vdash \Omega \uplus \{x: A_1\} \rhd \Gamma \uplus \{x: \tau_1\} \text{ and } \Delta \uplus \{\alpha: \star \to \star\} \vdash \Upsilon' \rhd_{\alpha\tau} \Gamma' \text{ and }$ the auxiliary judgements $\Delta \vdash \Upsilon_i \rhd_{\tau_i} \Gamma_i$ and $\alpha \notin FTV(\Gamma_i)$ and have that $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma' \uplus \{x : \tau_1\} \vdash e_2 : \tau'$.
- Similarly, using the induction on $\Delta \cup \{\alpha : \star \to \star\}$; dom $(\Omega) \vdash M_1 \rhd_{\alpha\tau} e_1$, with the expected auxiliary judgements, $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma' \vdash e_1 : \tau_1.$
- Finally, using the typing rules for abstraction (tp-abs), application (tp-app), and type

equivalence we have the desired conclusion $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma' \vdash (\lambda x : \tau_1.e_2)e_1 : \tau'$.

Cases The remaining cases follow by straightforward inversion and application of the induction

The case for $\Delta \uplus \{\alpha : \star \to \star\}; \operatorname{dom}(\Omega) \vdash \Theta \rhd_{\alpha\tau}^{\tau_A} e_{\Theta}$:

2

$$\forall c_i \in \mathrm{dom}(\Theta) \quad \Delta \uplus \{\alpha : \star \to \star\}; \mathrm{dom}(\Omega) \vdash \Theta(c_i) \rhd_{\alpha \tau} e_i$$

$$\Delta \uplus \{\alpha : \star \to \star\}; \mathrm{dom}(\Omega) \vdash \Theta \rhd_{\alpha \tau}^{\tau A} \lambda x : \Sigma^* \tau_A.\mathbf{case} \ x \ \mathbf{of} \ \mathbf{inj}_{\mathcal{L}(c_1)} \ y_1 \ \mathbf{in} \ (e_1 y_1)$$

$$\vdots$$

$$\mathbf{inj}_{\mathcal{L}(c_n)} y_n \ \mathbf{in} \ (e_n y_n)$$

ç

- From repeated use of Lemma C.8 (inversion) on

$$\Delta \uplus \{\alpha: \star \to \star \}; \Gamma \uplus \Gamma_1 \uplus \ldots \uplus \Gamma_n \uplus \Gamma' \vdash \\ \lambda x: \Sigma^* \tau_A \cdot \mathbf{case} \ x \ of \operatorname{inj}_{\mathcal{L}(c_1)} y_1 \operatorname{in} (e_1 y_1) \cdots \operatorname{inj}_{\mathcal{L}(c_n)} y_n \operatorname{in} (e_n y_n) : \Sigma^* \tau_A \to \tau_A$$

conclude $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma_1 \uplus \ldots \uplus \Gamma_n \uplus \Gamma' \uplus \{x : \Sigma^* \tau_A\} \uplus \{y_i : \tau_A \langle B_i \rangle\} \vdash e_i : \tau_A \langle B_i \rangle \to \tau_A$, for each e_i . Furthermore, we know that x and y_i are fresh, and do therefore do not appear free along with transitivity on type congruences (tp-eq-trans) and type equivalence (tp-eq) we can in e_i , so we can strengthen the typing derivations to $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma_1 \uplus \ldots \uplus \Gamma_n \uplus \Gamma' \vdash e_i : \tau_A \langle B_i \rangle \to \tau_A.$

- By Lemma C.16 (commutativity for iteration types) on and $\Delta \uplus \{\alpha : \star \to \star\} \vdash A \rhd_{\alpha\tau} \tau_A$ we have that $\Delta \uplus \{\alpha : \star \to \star\} \vdash A\langle B_i \to b \rangle \rhd_{\alpha\tau} \tau_A\langle B_i \to b \rangle$. Furthermore, by the definition of parameterization, we know that $\Delta \uplus \{\alpha : \star \to \star\} \vdash A\langle B_i \to b \rangle \rhd_{\alpha\tau} \tau_A\langle B_i \rangle \to \tau_A$.
- expected auxiliary judgements, we can conclude that $\Delta \uplus \{\alpha : \star \to \star\}; \Gamma \uplus \Gamma' \vdash e_i : \tau_A \langle B_i \rangle \to \tau_A$. Appealing to the induction hypothesis on $\Delta \uplus \{\alpha : \star \to \star\}; \operatorname{dom}(\Omega) \vdash \Theta(c_i) \rhd_{\alpha\tau} e_i$, with the

Using weakening, the typing rules for application (tp_app), case (tp_case), and abstraction (tp_abs) on each $\Delta \uplus \{\alpha : \star \to \star\}$; $\Gamma \uplus \Gamma' \vdash e_i : \tau_A \langle B_i \rangle \to \tau_A$ we have the desired result

$$\Delta \uplus \{\alpha: \star \to \star\}; \Gamma \uplus \Gamma' \vdash \\ \lambda x: \Sigma^* \tau_A \cdot \mathbf{case} \ x \ of \operatorname{inj}_{\mathcal{L}(c_1)} y_1 \operatorname{in} (e_1 y_1) \dots \operatorname{inj}_{\mathcal{L}(c_n)} y_n \operatorname{in} (e_n y_n) : \Sigma^* \tau_A \to \tau_A$$

We use the judgements $\Delta \vdash \tau \upharpoonright \kappa$ and $\Delta \vdash \tau \upharpoonright \kappa$ to indicate that type τ with kind κ is in weak head normal encoding do not follow trivially by inspection. However, it is possible to strengthen some of these inversion lemmas by recognizing that type encoding always produces types in \mathbb{F}_{ω} that are in weak head normal form. Since System F_{ω} treats types identical up the the equivalence relation $\Delta \vdash \tau_1 \equiv_{\beta\eta} \tau_2 : \kappa$, inversion lemmas that rely on the structure of types, such as inversion on typing derivations, type congruences, and type or weak head atomic form with respect to Δ

Lemma C.5 (Type encodings are weak head normal forms). If $\Delta \vdash \tau : \star \ and \ \Delta \vdash A \rhd_{\tau} \ \tau_{A} \ then$

Lemma C.6 (Weak head types are well-formed types).

Proof. By straightforward induction over the structure of $\Delta \vdash A \rhd_{\tau} \tau_A$.

- 1. If $\Delta \vdash \tau \mid \star then \ \Delta \vdash \tau : \star$.
- 2. If $\Delta \vdash \tau \upharpoonright \star then \ \Delta \vdash \tau : \star$.

Proof. By trival mutal induction over the structure of $\Delta \vdash \tau \mid \star$ and $\Delta \vdash \tau \mid \star$.

Lemma C.7 (Well-formedness of type encoding). If $\Delta \vdash \tau : \star \ and \ \Delta \vdash A \rhd_{\tau} \ \tau_{A} \ then \ \Delta \vdash \tau_{A} : \star$.

Proof. Follows directly from Lemma C.5 and Lemma C.6.

Lemma C.8 (Inversion on typing derivations).

- 1. If $\Delta; \Gamma \vdash x : \tau$ then $\Gamma(x) = \tau'$ where $\Delta \vdash \tau \equiv_{\beta\eta} \tau' : \star$.
- 2. If Δ ; $\Gamma \vdash e_1e_2 : \tau$ then Δ ; $\Gamma \vdash e_1 : \tau_1 \to \tau_2$ and Δ ; $\Gamma \vdash e_2 : \tau_1$ where $\Delta \vdash \tau \equiv_{\beta\eta} \tau_2 : \star$.
- 3. If $\Delta; \Gamma \vdash \lambda x : \tau_1.e : \tau$ then $\Delta; \Gamma \uplus \{x : \tau_1\} \vdash e : \tau'$ where $\Delta \vdash \tau \equiv_{\beta\eta} \tau_1 \rightarrow \tau' : \star$.
- 4. If $\Delta; \Gamma \vdash \langle \rangle : \tau \text{ then } \Delta \vdash \tau \equiv_{\beta\eta} \forall \alpha : \star.1(\alpha) : \star.$

c

- 5. If $\Delta, \Gamma \vdash \Lambda \alpha : \kappa.e : \tau$ then $\Delta \uplus \{\alpha : \kappa\}; \Gamma \vdash e : \tau'$ where $\Delta \vdash \tau \equiv_{\beta\eta} \forall \alpha : \kappa.\tau' : \star$.
- 6. If Δ ; $\Gamma \vdash e[\tau_1] : \tau$ then Δ ; $\Gamma \vdash e : \forall \alpha : \kappa . \tau'$ where $\Delta \vdash \tau_1 : \kappa$ and $\Delta \vdash \tau \equiv_{\beta\eta} \tau' \{\tau_1'/\alpha\} : \star$ and
- 7. If $\Delta : \Gamma \vdash \mathbf{case} \ eofinj_{l_1} x_1 \mathbf{in} e_1 \dots \mathbf{in} j_{l_n} x_n \mathbf{in} e_n : \tau \ then \ \Delta : \Gamma \vdash e : \langle l_1 : \tau_1, \dots, l_n : \tau_n \rangle \ and \ \Delta : \Gamma \vdash \{x_i : \tau_i\} \vdash e_i : \tau' \ for \ each \ e_i \ where \ \Delta \vdash \tau \equiv_{\beta\eta} \tau' : \star.$

Proof. By straightforward induction over the number of uses of tp_eq used before the final derivation

Lemma C.9 (Inversion for type congruences).

- 1. If $\Delta \vdash 1(\tau) \equiv_{\beta\eta} \tau' : \star \ and \ \Delta \vdash \tau' \upharpoonright \star \ then \ \tau' = 1(\tau'') \ where \ \Delta \vdash \tau \equiv_{\beta\eta} \tau'' : \star$.
- 2. If $\Delta \vdash \operatorname{Rec} \Sigma^* \tau \equiv_{\beta\eta} \tau' : \star \ and \ \Delta \vdash \tau' \upharpoonright \star \ then \ \tau' \equiv \tau_1 \to \tau_2 \ \ where \ \Delta \vdash \Sigma^* \tau \to \tau \equiv_{\beta\eta} \tau_1 : \star \ and$
- 3. If $\Delta \vdash \tau_1 \to \tau_2 \equiv_{\beta\eta} \tau' : \star \ and \ \Delta \vdash \tau' \upharpoonright \star \ then \ \tau' = \tau_1' \to \tau_2' \ \ where \ \Delta \vdash \tau_1 \equiv_{\beta\eta} \tau_1' : \star \ and$ $\Delta \vdash \tau_2 \equiv_{\beta\eta} \tau'_2 : \star$.
- 4. If $\Delta \vdash \tau_1 \times \tau_2 \equiv_{\beta\eta} \tau' : \star$ and $\Delta \vdash \tau' \upharpoonright \star$ then $\tau' = \tau'_1 \times \tau'_2$ where $\Delta \vdash \tau_1 \equiv_{\beta\eta} \tau'_1 : \star$ and $\Delta \vdash \tau_2 \equiv_{\beta\eta} \tau'_2 : \star$.

5. If $\Delta \vdash \forall \alpha : \star \to \star .\tau \equiv_{\beta\eta} \tau' : \star \ and \ \Delta \vdash \tau' \upharpoonright \star \ then \ \tau' = \forall \alpha : \star \to \star .\tau'' \ where$ $\Delta \boxplus \{\alpha : \star \to \star\} \vdash \tau \equiv_{\beta n} \tau'' : \star.$

Proof. By induction over the structure of the type congruences.

Lemma C.10 (Inversion for type encoding).

- 1. If $\Delta \vdash A \rhd_{\tau} \tau_A$ and $\Delta \vdash \tau_A \equiv_{\beta\eta} \text{Rec } \Sigma^* \ \tau : \star \ then \ A = b$.
- 2. If $\Delta \vdash A \rhd_{\tau} \tau_A$ and $\Delta \vdash A_1 \rhd_{\tau} \tau_1$ and $\Delta \vdash \tau_A \equiv_{\beta\eta} \tau_1 \to \tau_2 : \star \text{ then } \Delta \vdash A_2 \rhd_{\tau} \tau_2' \text{ where }$ $A = A_1 \rightarrow A_2 \text{ and } \tau_A = \tau_1 \rightarrow \tau_2'.$
- 3. If $\Delta \vdash A \rhd_{\tau} \tau_{A}$ and $\Delta \vdash \tau_{A} \equiv_{\beta\eta} \forall \alpha : \star \to \star \tau_{A}' : \star$ then $\Delta \uplus \{\alpha : \star \to \star \star\} \vdash A' \rhd_{\alpha\tau} \tau_{A}''$ where $\Delta \uplus \{\alpha : \star \to \star\} \vdash \tau_{A}' \equiv_{\beta\eta} \tau_{A}'' : \star$ and $A = \Box A'$ and $\tau_{A} = \forall \alpha : \star \to \star \tau_{A}''$.
- 4. If $\Delta \vdash A \rhd_{\tau} \tau_A$ and $\Delta \vdash \tau_A \equiv_{\beta\eta} 1(\tau') : \star \text{ then } A = 1.$
- 5. If $\Delta \vdash A \rhd_{\tau} \tau_A$ and $\Delta \vdash \tau_A \equiv_{\beta\eta} \tau_1 \times \tau_2 : \star$ then $\Delta \vdash A_1 \rhd_{\tau} \tau_1'$ where $\Delta \vdash A_2 \rhd_{\tau} \tau_2'$ where $A = A_1 \times A_2$ and $\tau_A = \tau_1' \times \tau_2'$.

Proof. By inversion over the structure of the type congruence. For Part 1:

- By Lemma C.5 (type encodings are weak head normal) on $\Delta \vdash A \rhd_{\tau} \tau_A$ we know that $\Delta \vdash \tau_A \upharpoonright \star$ $\Delta \vdash \tau_1 \equiv_{\beta\eta} \Sigma^* \tau \to \tau : \star$. Given that $\Delta \vdash A \rhd_{\tau} \tau_1 \to \tau_2$, either A = b or $A = A_1 \to A_2$ for some Using Lemma C.9 (inversion) on $\Delta \vdash \tau_A \equiv_{\beta\eta} \operatorname{Rec} \Sigma^* \tau : \star$ we know that $\tau_A = \tau_1 \to \tau_2$ where
- $\Delta \vdash A_1 \rhd_{\tau} \tau_1$. Using Lemma C.5 again on $\Delta \vdash A_1 \rhd_{\tau} \tau_1$ we know that $\Delta \vdash \tau_1 \upharpoonright \star$. Again by Lemma • Assume that $A = A_1 \to A_2$. Then by inversion on $\Delta \vdash A_1 \to A_2 \rhd_\tau \tau_1 \to \tau_2$ we have that C.9 on $\Delta \vdash \tau_1 \equiv \beta_\eta \sum^* \tau \to \tau : \star$ we have that $\tau_1 = \tau_1' \to \tau_1''$ where $\Delta \vdash \tau_1' \equiv \beta_\eta \sum^* \tau : \star$ and $\Delta \vdash \tau_1'' \equiv \beta_\eta \tau : \star$. As before $A_1 = b$ or $A_1 = A_1' \to A_1''$ for some A_1', A_1'' .

- Assume $A_1 = b$. Then $\tau_1' = \Sigma^* \tau \to \tau$ and $\tau_1'' = \tau$. However, $\Delta \vdash \Sigma^* \tau \to \tau \not\equiv_{\beta\eta} \Sigma^* \tau : \star$ as there is no way to make a variant and function equivalent.
- Using Lemma C.5 yet again we know that $\Delta \vdash \tau_1' \upharpoonright \star$. However, we know that $\Delta \vdash \tau_1' \equiv \beta n \ \Sigma^* \tau : \star$. Therefore $A_1 = A_1' \to A_1''$. By inversion on $\Delta \vdash A_1' \to A_1'' \supset_\tau \tau_1' \to \tau_1''$ we have that $\Delta \vdash A_1' \supset_\tau \tau_1'$ There are no types in the image of the encoding where the head constructor is equivalent to a variant. So our assumption that $A = A_1 \to A_2$ must false, and A = b.

Port 9.

- By Lemma C.5 (type encodings are weak head normal) on $\Delta \vdash A \rhd_{\tau} \tau_A$ we know that $\Delta \vdash \tau_A \upharpoonright \star$. Using Lemma C.9 (inversion) on $\Delta \vdash \tau_A \equiv \beta_\eta \tau_1 \to \tau_2$: we know that $\tau_A = \tau_1' \to \tau_2'$ where $\Delta \vdash \tau_1 \equiv \beta_\eta \tau_1'$: \star . Given that $\Delta \vdash A \rhd_\tau \tau_1' \to \tau_2'$, either A = b or $A = A_1' \to A_2'$ for some A_1', A_2' .
- Assume A = b. ¹⁰

Lemma C.11 (Type encoding is total and decidable). Given a type, A, in the source calculus and a τ in F_{ω} we can construct $\Delta \vdash A \rhd_{\tau} \tau_A$.

Proof. By straightforward induction over the structure of A.

types, known only to be congruent, are the result of encoding the same source language type. It is possible to further strengthen the conclusion following lemma to also state that τ_1 and τ_2 must also be syntactically Another difficulty that arises in the backward direction of the static correctness proof is showing that two in addition to semantically equivalent using Lemma C.11, but it is not necessary for the proofs.

Lemma C.12 (Type encoding with congruent results). If $\Delta \vdash \tau : \star \ and \ \Delta \vdash A_1 \rhd_{\tau} \tau_1 \ and$ $\Delta \vdash A_2 \rhd_{\tau} \tau_2 \text{ where } \Delta \vdash \tau_1 \equiv_{\beta\eta} \tau_2 : \star \text{ then } A_1 = A_2.$

Proof. By induction over the structure of $\Delta \vdash A_1 \rhd_{\tau} \tau_1$ using inversion on $\Delta \vdash A_2 \rhd_{\tau} \tau_2$.

П

1. If
$$\Delta \vdash A \rhd_{\tau} \tau_{A}$$
 and $\Delta \vdash A \rhd_{\tau} \tau'_{A}$ then $\tau_{A} = \tau'_{A}$.

2. If
$$\Delta \vdash A \rhd_{\tau} \tau$$
 and $\Delta \vdash A' \rhd_{\tau} \tau$ then $A = A'$.

Proof. Both properties follow by straightforward simultaneous induction on the type encoding

Lemma C.14 (Type encoding under congruent worlds). If $\Delta \vdash A \rhd_{\tau_1} \tau_A$ and $\Delta \vdash A \rhd_{\tau_2} \tau_A'$ where $\Delta \vdash \tau_1 \equiv_{\beta\eta} \tau_2 : \star then \ \Delta \vdash \tau_A \equiv_{\beta\eta} \tau'_A : \star$

Proof. By straightforward simultaneous induction on the type encoding derivations.

Lemma C.15 (World substitution for type encoding). If $\Delta \uplus \{\alpha : \star \to \star\} \vdash A \rhd_{\alpha\tau'} \tau_A \text{ and }$ $\Delta \vdash \tau : \star \to \star then \ \Delta \vdash A \rhd_{\tau\tau'} \tau_A \{\tau/\alpha\}.$

Proof. By straightforward induction over the structure of $\Delta \uplus \{\alpha : \star \to \star\} \vdash A \rhd_{\alpha\tau'} \tau_A$.

Lemma C.16 (Commutativity for parameterization and type encoding). If $\Delta \vdash B \rhd_{\tau} \tau_B$ then

1.
$$\tau_B = (\text{Rec } \Sigma^* \ \tau) \langle B \rangle$$
.

37

2.
$$\Delta \vdash \tau_B \equiv_{\beta\eta} B^*(\text{Rec } \Sigma^* \ \tau) : \star$$
.

Proof. By straightforward induction over the structure of
$$\Delta \vdash B \rhd_{\tau} \tau_B$$
.

Lemma C.17 (Commutativity for iteration types and type encoding). If $\Delta \vdash A \rhd_{\tau} \tau_A$ then

 $^{^{10}\}mathrm{finish}$

$$\Delta \vdash A\langle B \rangle \rhd_{\tau} \tau_A \langle B \rangle$$
Proof. By straightforward induction over the structure of $A\langle B \rangle$.

Lemma C.18 (roll typing). $\varnothing : \varnothing \vdash \text{roll} : \forall \alpha : \star . \Sigma^*(\text{Rec } \Sigma^* \alpha) \to \text{Rec } \Sigma^* \alpha$

Proof. By inspection of the definition in Figure 7 (Library Routines).

Lemma C.19 (iter typing). $\varnothing; \varnothing \vdash \mathbf{iter}\{\tau: \star \to \star\} \colon \forall \gamma: \star \cdot \forall \alpha: \star \cdot (\Sigma^* \alpha \to \alpha) \to (\forall \beta: \star \to \star . \tau (\mathsf{Rec}\ \Sigma^*\ \beta \gamma)) \to \tau \alpha$

Proof. By inspection of the definition in Figure 7 (Library Routines).

Lemma C.20 (Encoding produces well-formed environments). Assume $\Delta \vdash \tau : \star$.

- 1. If $\Delta \vdash \Upsilon \rhd_{\tau} \Gamma_1$ then $\Delta \vdash \Gamma_1$.
- 2. If $\Delta \vdash \Omega \rhd \Gamma_2$ then $\Delta \vdash \Gamma_2$.

Proof. Straightforward from the definitions and Lemma C.7.

Lemma C.21 (Type containment). Given a derivation $\Delta \vdash A \rhd_{\tau} \tau_A$ we know that $FTV(\tau) = FTV(\tau_A)$.

Proof. By straightforward induction over the structure of $\Delta \vdash A \rhd_{\tau} \tau_{A}$.

Dynamic correctness

 Δ ; $\Gamma \vdash e \equiv \beta \eta \quad e' : \tau$ between target terms of type τ . This congruence relation includes the standard β and η -equivalences for functions, products and unit. The complete definition can be found in Appendix G.6. We prove the dynamic correctness of our encoding with respect to the equivalence relation We will use the equals symbol, =, when we intend syntactic equality. In order to aid in reasoning about the operational behavior iteration, we first define an inverse to openiter, called uniter, constructed from the second component of xmap.

Definition D.1 (uniter).

$$\mathbf{uniter}\{\tau: \star \to \star\} : \forall \alpha: \star, (\Sigma^*\alpha \to \alpha) \to \tau\alpha \to \tau(\text{Rec } \Sigma^*\alpha) \\ \mathbf{uniter}\{\tau: \star \to \star\} = \Lambda\alpha: \star, \lambda f: \Sigma^*\alpha \to \alpha. \mathbf{snd} \left(\mathbf{xmap}\{\tau\} [\text{Rec } \Sigma^*\alpha][\alpha] \langle \mathbf{cata}[\alpha]f, \mathbf{place}[\alpha] \rangle \right)$$

Throughout the proofs in this section the following equivalences will be required many times, so for conciseness we state them all here.

Lemma D.2 (Properties of openiter and uniter). Assuming $\Delta \vdash \tau : \star \to \star$ and $\Delta \vdash \tau' : \star$.

$$1. \ \Delta; \{f: \Sigma^*\tau' \to \tau'\} \vdash (\mathbf{openiter} \P\tau [\tau'] \ f) \circ (\mathbf{uniter} \{\tau\} [\tau'] \ f) \equiv_{\beta\eta} \lambda x : \tau\tau'.x : \tau\tau' \to \tau\tau'$$

2.
$$\Delta$$
; $\{f: \Sigma^*\tau' \to \tau', e: b^*(\text{Rec } \Sigma^* \ \tau')\} \vdash \text{openiter}\{b^*\}[\tau'] \ f \ e \equiv_{\beta\eta} e f: \tau'$

3.
$$\Delta_{1}\{f: \Sigma^{*}\tau' \to \tau', e: (B_{1} \to B_{2})^{*}(\text{Rec }\Sigma^{*}\tau')\} \vdash \text{openiter}\{(B_{1} \to B_{2})^{*}\|[\tau'] f e \equiv_{\beta\eta} \text{ (openiter}\{B_{3}^{*}\|[\tau'] f) \circ e \circ (\text{uniter}\{B_{1}^{*}\|[\tau'] f) : (B_{1} \to B_{2})^{*}\tau'\}\}$$

; $\{f: \Sigma^* \tau' \to \tau', e: (B_1 \to B_2)^* \tau'\} \vdash$
uniter $\{(B_1 \to B_2)^* \}^* [\tau'] f e \equiv_{\beta\eta}$
(uniter $\{\{B_2^*\}^* [\tau'] f) \circ e \circ (\text{openiter} \{B_1^*\}^* [\tau'] f) : (B_1 \to B_2)^* (\text{Rec } \Sigma^* \}$

$$(\text{uniter}\{B_2^*\}[\tau']\ f)\circ e\circ (\text{openiter}\{B_1^*\}[\tau']\ f): (B_1\to B_2)^*(\text{Rec}\ \Sigma^*)$$

6.
$$\Delta$$
; $\{f: \Sigma^*\tau' \to \tau', e: (B_1 \times B_2)^*\tau'\}$

$$\begin{array}{l} \mathbf{uniter} \{(B_1 \times B_2)^*\}[\tau'] \ f \ e \equiv_{\beta\eta} \\ \langle \mathbf{uniter} \{B_1^*\}[\tau'] \ f \ (\mathbf{fst} \ c), \mathbf{uniter} \{B_2^*\}[\tau'] \ f \ (\mathbf{snd} \ e) \rangle : (B_1 \times B_2)^* (\mathsf{Rec} \ \Sigma^* \ \tau') \end{array}$$

$$7. \ \Delta_{i} \left\{ f : \Sigma^{*}\tau' \to \tau', e : B_{i}^{*}(\operatorname{Rec} \Sigma^{*} \tau') \right\} \vdash \\ \text{openiter} \left\{ \Sigma^{*} \right\} \left[\tau' \right] f \left(\inf_{i_{i}} e \text{ of } \Sigma^{*}(\operatorname{Rec} \Sigma^{*} \tau') \right) \equiv \beta_{\eta} \\ \inf_{i_{i}} \left(\operatorname{openiter} \left\{ B_{i}^{*} \right\} \right\} \left[\tau' \right] f e) \text{ of } \Sigma^{*}\tau' : \Sigma^{*}\tau'$$

$$\begin{split} \mathcal{S}. \ \Delta; \{f: \Sigma^*\tau' \to \tau'\} \vdash \\ \mathbf{openiter} \{(B_i \to b)^*\}[\tau'] \ e_\Theta \ (\lambda x: \tau_B. \mathbf{roll}[\tau](\mathbf{inj}_{\mathcal{L}(c_i)} \ x \ \mathbf{of} \ \Sigma^*(\mathrm{Rec} \ \Sigma^* \ \tau'))) \equiv_{\beta\eta} \\ \lambda x: B_i^*\tau'. e_\Theta(\mathbf{inj}_{\mathcal{L}(c_i)} \ x \ \mathbf{of} \ \Sigma^*(\mathrm{Rec} \ \Sigma^* \ \tau')): (B_i \to b)^*\tau' \end{split}$$

Proof. Property 1 is by straightforward induction on the structure B. The proofs of properties 2, 3, 4, 5, 6, 7, and 8 follow directly from the rules term of congruence and the definitions of **openiter**, **xmap** and Statically the source language only allows for replacements for constants, but during iteration mappings for iteration, we need to have some notion of well-formedness for replacements that contain variable mappings. free variables are added to replacements. Therefore, in order to reason about the dynamic correctness of

Definition D.3 (Well-formed dynamic replacements).

$$\begin{array}{ccc} \forall c_i \in \mathrm{dom}(\Sigma) & \Sigma(c_i) = B_i & \Omega; \, \Upsilon \vdash \Theta(c_i) : A\langle B_i \rangle \\ \forall x_i \in \mathrm{dom}(\Psi) & \Psi(x_i) = B_i' & \Omega; \, \Upsilon \vdash \Theta(x_i) : A\langle B_i' \rangle \\ \Omega; \, \Upsilon \vdash \Theta : A\langle \Psi_i \Sigma \rangle \end{array} \text{ tp-rep-var}$$

Lemma D.4 (Well-typed replacements are well-formed dynamic replacements). If Ω ; $\Upsilon \vdash \Theta : A\langle \Sigma \rangle$ then Ω ; $\Upsilon \vdash \Theta : A\langle \varnothing ; \Sigma \rangle$.

Proof. Follows trivially from the definitions.

Lemma D.5 (Typing for elimination).

- 1. If $\Psi \vdash V \uparrow\!\!\!\!/ B \ and \Omega$; $\Upsilon \vdash \Theta : A(\Psi, \Sigma) \ then \ \Omega$; $\Upsilon \vdash \langle A, \Psi, \Theta \rangle(V) : A\langle B \rangle$.
- 2. If $\Psi \vdash V \downarrow B$ and Ω ; $\Upsilon \vdash \Theta : A\langle \Psi, \Sigma \rangle$ then Ω ; $\Upsilon \vdash \langle A, \Psi, \Theta \rangle(V) : A\langle B \rangle$.
- 3. If $\Psi \vdash x \downarrow B$ and Ω ; $\Upsilon \vdash \Theta : A(\Psi; \Sigma)$ then Ω ; $\Upsilon \vdash \Theta(x) : A\langle B \rangle$.
- 4. If $\Psi \vdash c \downarrow B \to b \text{ and } \Omega$; $\Upsilon \vdash \Theta : A(\Psi, \Sigma) \text{ then } \Omega$; $\Upsilon \vdash \Theta(c) : A(B \to b)$.

Proof. Parts 1 and 2 follow by mutual induction over the structure of $\Psi \vdash V \uparrow B$ and $\Psi \vdash V \downarrow B$. Parts 3 and 4 follow as corollaries.

Because the operational semantics of the SDP calculus depends on the definition of elimination,

 $(A, \Psi, \Theta)(V)$ we must define an encoding from an elimination form to a term in the target calculus so that free variables in V. We will replace each variable with an **uniter** term that will hold its mapping from Θ . we may prove dynamic correctness of the encoding. The first step is to define a substitution for all of the For these derived encodings we will use a black triangle, \blacktriangleright rather than an a white one, \triangleright to help distinguish between them and the standard encodings. We create a substitution (notated $\Delta; \Psi; \Theta; e_{\Theta} \triangleright_{\tau}^{\tau_A} S$) as follows:

Definition D.6 (Elimination Substitution).

$$\frac{\Delta;\Psi;\Theta;\Theta_{\varphi} \nearrow^{7}A}{\Delta;\Theta;\Theta_{\varphi} \nearrow^{7}A} \underbrace{\{\}}_{\text{con}} \text{ sub-empty} \\ \frac{\Delta;\Psi \uplus \{x:B\};\Theta;\Theta_{\varphi} \nearrow^{7}A S \cdot \{\{(\mathbf{uniter} \|B^*\}[\tau_A] \cdot \Theta \cdot e')/x\}}{\Delta;\Psi \uplus \{x:B\};\Theta;\Theta_{\varphi} \nearrow^{7}A S \cdot \{(\mathbf{uniter} \|B^*\}[\tau_A] \cdot \Theta \cdot e')/x\}} \text{ sub-constant}$$

Lemma D.7 (Substitution application). If $\Delta; \Psi; \Theta; e_{\Theta} \triangleright_{\tau}^{\tau_A} S \ and \ \Psi(x) = B \ then$

 $S(x) = \mathbf{uniter}\{B^*\}[\tau_A] \ e_{\Theta} \ e' \ where \ \Delta; \varnothing \vdash \Theta(x) \rhd_{\tau} e'.$

Proof. Straightforward induction on the structure of Δ ; Ψ ; Θ ; $e_{\Theta} \triangleright_{\tau^A}^{\tau_A} S$.

Lemma D.8 (Static correctness with substitution). If $\Delta; \varnothing \vdash V \rhd_{\tau_A} e$ and $\Psi \vdash V \Uparrow B$ and $\Delta \vdash B \rhd_{\tau_A} \tau_B \text{ and } \Delta; \Psi; \Theta; e_{\Theta} \blacktriangleright_{\tau}^{\tau_A} S \text{ then } \Delta; \varnothing \vdash S(e) : \tau_B.$ Proof. Follows from Theorem C.2 (static correctness, forward direction), Definition C.1 (environment encoding), Lemma D.7 (substitution application), and Lemma D.5 (elimination typing).

Then given an elimination, we may encode it with openiter as follows:

Definition D.9 (Encoding of elimination).

The next lemma states that the encoding of an elimination is β, η -equivalent to the encoding of the result of elimination over M in the source calculus. Lemma D.10 (Dynamic correctness of elimination). If Ω ; $\Upsilon \vdash \Theta : A\langle \Psi ; \Sigma \rangle$ and $\langle A, \Psi, \Theta \rangle(V) = M$ $and \ \Delta; \mathrm{dom}(\Omega) \vdash \langle A, \Psi, \Theta \rangle(V) \blacktriangleright_{\tau}^{\tau_A} e \ and \ \Delta; \mathrm{dom}(\Omega) \vdash M \rhd_{\tau} e' \ and \ \Delta \vdash \Omega \rhd \Gamma_1 \ and \ \Delta \vdash \Upsilon \rhd_{\tau} \Gamma_2 \ then$ $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e \equiv_{\beta\eta} e' : B^* \tau_A.$

Proof. By induction on $\langle A, \Psi, \Theta \rangle(V)$.

$$\langle A, \Psi, \Theta \rangle(x) \triangleq \Theta(x)$$
 el_var

- By inversion on Δ ; dom $(\Omega) \vdash \langle A, \Psi, \Theta \rangle(x) \blacktriangleright_{\tau^A}^{\tau_A} e$ we know that $e = \mathbf{openiter} \{B^*\}[\tau_A] e_{\Theta} S(e_{\nu})$ and $\Delta; \Psi; \Theta; e_{\Theta} \blacktriangleright_{\tau^A}^{\tau_A} S$ and $\Delta \vdash A \rhd_{\tau} \tau_A$ and $\Psi \vdash x \uparrow\!\!\!/ B$.
- It follows from typing of atomic and canonical forms[24] on $\Psi \vdash x \uparrow B$ that $\varnothing \colon \Psi \vdash x \colon B$. By inversion on \varnothing ; $\Psi \vdash x : B$ we know that $\Psi(x) = B$.
- By Lemma D.7 (elimination substitution application) on $\Delta; \Psi; \Theta; e_{\Theta} \blacktriangleright_{\tau^A}^{\tau_A} S$ and $\Psi(x) = B$ we have that $S(x) = \mathbf{uniter} \{B^*\}[\tau_A] e_{\Theta} e' \text{ where } \Delta; \varnothing \vdash \Theta(x) \rhd_{\tau} e'.$

- $\Psi \vdash x \Uparrow B$ we have that Ω ; $\Upsilon \vdash M : A\langle B \rangle$. By use of Lemma C.17 (communitivity of encoding Using Lemma D.5 (typing for elimination) on $\Omega; \Upsilon \vdash \Theta : A\langle \Psi; \Sigma \rangle$ and $\langle A, \Psi, \Theta \rangle(x) = M$ and on iteration types) on $\Delta \vdash A \rhd_{\tau} \tau_A$ we can conclude $\Delta \vdash A\langle B \rangle \rhd_{\tau} \tau_A\langle B \rangle$.
- Ω ; $\Upsilon \vdash M : A\langle B \rangle$, we have that Δ ; $\Gamma_1 \uplus \Gamma_2 \vdash e' : \tau_A\langle B \rangle$. By type equivalence (tp_eq) we know By using Theorem C.2 (static correctness, forward direction) on $\Delta; \varnothing \vdash M \rhd_{\tau} e'$, with the auxiliary judgements $\Delta \vdash \Upsilon \rhd_{\tau} \Gamma_1$ and $\Delta \vdash \Omega \rhd \Gamma_2$ and $\Delta \vdash A\langle B \rangle \rhd_{\tau} \tau_A\langle B \rangle$ and that Δ ; $\Gamma_1 \uplus \Gamma_2 \vdash e' : B^*\tau_A$.
- $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash ((\mathbf{openiter} \P B^*)[\tau_A] e_{\Theta}) \circ (\mathbf{uniter} \{B^*\}[\tau_A] e_{\Theta}))e' \equiv_{\beta\eta} e' : B^*\tau_A. \text{ Consequently, by }$ undoing the composition and using the definition of the substution S, we have the desired result reflection (eq_refl) on $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e' : B^*\tau_A$ we know that $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e' \equiv_{\beta\eta} e' : B^*\tau_A$. This $\varnothing;\varnothing \vdash (\mathbf{openiter} \{\!\!\{B^*\}\!\!\}[\tau_A]\ e_\Theta) \circ (\mathbf{uniter} \{\!\!\{B^*\}\!\!\}[\tau_A]\ e_\Theta) \equiv_{\beta\eta} \lambda z : B^*\tau_A.z : B^*\tau_A \to B^*\tau_A. \ \mathrm{By}$ equivalence along with weakening, congruence of application (eq-app), β -equivalence (eq_abs_beta), and transitivity (eq_trans) means we can conclude By Lemma D.2 (properties of iter, part 3) and

986

 $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter}\{B^*\}[\tau_A] \ e_\Theta \ S(x) \equiv_{\beta\eta} e' : B^*\tau_A.$

$\langle A, \Psi, \Theta \rangle (c) \triangleq \Theta(c_i)$ el_const

- By inversion on Δ ; dom $(\Omega) \vdash \langle A, \Psi, \Theta \rangle (c_i) \blacktriangleright_{\tau}^{\tau_A} e$ we know that $e = \mathbf{openiter} \{B\}[\tau_A] e_{\Theta} S(e_v)$ and $\Delta; \Psi; \Theta; e_{\Theta} \blacktriangleright_{\tau}^{\tau_A} S$ and $\Delta; \varnothing \vdash c_i \rhd_{\tau_A} e_v$ and $\Delta \vdash A \rhd_{\tau} \tau_A$ and $\Delta; \text{dom}(\Omega) \vdash \Theta \rhd_{\tau}^{\tau_A} e_{\Theta}$ and

- encoding on iteration types) on $\Delta \vdash A \rhd_{\tau} \tau_A$ we can conclude $\Delta \vdash A\langle B_1 \rangle \rhd_{\tau} \tau_A\langle B_1 \rangle$. Therefore, $\Delta \vdash A(B_1) \rhd_{\tau} \tau'_A$ and and Δ ; dom $(\Omega) \vdash M \rhd_{\tau} e''$. By use of Lemma C.17 (communitivity of By inversion on Δ ; dom $(\Omega) \vdash \lambda x : A\langle B \rangle . M \rhd_{\tau} e'$ we know that $e' = \lambda x : \tau'_A . e''$ and by Lemma C.13 (uniqueness of type encoding) that $\tau'_A = \tau_A \langle B_1 \rangle$.
- By the typing rule for variables (tp_var) we can conclude Ω ; $\Upsilon \uplus \{x' : A\langle B_1 \rangle\} \vdash x' : A\langle B_1 \rangle$. Using $\Omega;\Upsilon\vdash\Theta:A\langle\Psi;\Sigma\rangle\text{ we can conclude }\Omega;\Upsilon\uplus\{x':A\langle B_1\rangle\}\vdash\Theta\uplus\{x\mapsto x'\}:A\langle\Psi\uplus\{x:B_1\};\Sigma\rangle.$ this derivation, weakening, and Definition D.3 (well-formed dynamic replacements) on
- We have $\Delta \vdash \Upsilon \rhd_{\tau} \Gamma_2$ and $\Delta \vdash A\langle B_1 \rangle \rhd_{\tau} \tau_A \langle B_1 \rangle$ so by Definition C.1 (environment encoding) we can conclude $\Delta \vdash \Upsilon \uplus \{x' : A\langle B_1 \rangle\} \rhd_\tau \Gamma_2 \uplus \{x : \tau_A \langle B_1 \rangle\}$
- Therefore, by induction on Ω ; $\Upsilon \uplus \{x' : A\langle B_1 \rangle\} \vdash \Theta \uplus \{x \mapsto x'\} : A\langle \Psi \uplus \{x : B_1\}; \Sigma \rangle$ and $\langle A, \Psi \uplus \{x : B\}, \Theta \uplus \{x \mapsto x'\} \rangle (V) = M$ and

$$\Delta; \operatorname{dom}(\Omega) \vdash (A, \Psi \uplus \{x : B\}, \Theta \uplus \{x \mapsto x'\}) \langle V \rangle \blacktriangleright_{T^A}^{\tau_A}$$
 openiter $\{B_2^*\} \upharpoonright_{T^A} \in (S \cdot \{ \text{uniter} \{B_1^*\} \upharpoonright_{T^A}] \in \mathcal{X}'/x \}) (e_v')$

 $\Delta; \Gamma_1 \uplus \Gamma_2 \uplus \{x : \tau_A'\} \vdash \mathbf{openiter} \{B_2^*\}[\tau_A] \in_\Theta (S \cdot \{\mathbf{uniter} \{B\}[\tau_A] \in_\Theta x'/x\})(e_v') \equiv_{\beta\eta} e'' : B_2^*\tau_A.$ and Δ ; dom $(\Omega) \vdash M \rhd_{\tau_A} e''$ and $\Delta \vdash \Omega \rhd \Gamma_1$ and $\Delta \vdash \Upsilon \uplus \{x' : A\langle B_1 \rangle\} \rhd_{\tau} \Gamma_2 \uplus \{x : \tau_A\langle B_1 \rangle\}$ we

Using the term congruence rule for abstraction (eq.abs) and type equivalence (eq.tp-eq) we can

$$\Delta ; \Gamma_1 \uplus \Gamma_2 \vdash \lambda x' : \tau_A \langle B_1 \rangle. \mathbf{openiter} \{ B_2^* \} [\tau_A] \ e_{\ominus} \ (S \cdot \{ \mathbf{uniter} \{ B \} [\tau_A] \ e_{\ominus} \ x'/x \}) (e_v') \equiv_{\beta \eta} \lambda x' : \tau_A \langle B_1 \rangle_{e''} : (B_1 \to B_2)^* \tau_A$$

By pulling out the substitution {uniter{B}[τ_A] $e_{\Theta} x'/x$ }, β -equivalence (eq_abs_beta) and $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter} \{\!\!\{ (B_1 \to B_2)^* \!\!\} \!\! [\tau_A] \ e_\Theta \ S(e_v') \equiv_{\beta\eta} \lambda x' : \tau_A \langle B_1 \rangle . e'' : (B_1 \to B_2)^* \tau_A \}$ Lemma D.2 (properties of iteration, part 3) we can conclude the desired result

Cases The remaining cases are uncomplicated uses of the induction hyothesis and congruences.

For the case where $V = V_1V_2$ in the above proof we require the following lemma about how iteration interacts with application:

Lemma D.11 (Iteration and atomic applications). If Ω , $\Upsilon \vdash \Theta : A\langle \Psi ; \Sigma \rangle$ and $\Delta \vdash \Omega \rhd \Gamma_1$ and $\Delta \vdash \Upsilon \rhd_{\tau} \Gamma_{2}$ and $\Psi \vdash V_{1}V_{2} \downarrow B_{2}$ and $\Psi \vdash V_{1} \downarrow B_{1} \rightarrow B_{2}$ and $\Psi \vdash V_{2} \Uparrow B_{1}$ and $\Delta ; \varnothing \vdash V_{1} \rhd_{\tau_{A}} e_{1}$ and $\Delta; \varnothing \vdash V_2 \rhd_{\tau_A} e_2 \text{ and } \Delta; \Psi; \Theta; e_{\Theta} \blacktriangleright_{\tau^A}^{\tau_A} S \text{ then }$

$$\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter} \{B_2^*\}[\tau_A] \ e_{\Theta} \ S(e_1 \ e_2) \equiv_{\beta\eta} \\ (\mathbf{openiter} \{(B_1^* \to B_2)^*\}[\tau_A] \ e_{\Theta} \ S(e_1)) (\mathbf{openiter} \{B_1^*\}[\tau_A] \ e_{\Theta} \ S(e_2)) : B^*\tau_A$$

Proof. We cannot prove this lemma directly, but it follows from the more general Lemma D.22 (Iteration and atomic forms).

about the dynamic behavior of iteration over atomic terms. Our iteration contexts are similar in flavor to machinery we will call iteration contexts. Iteration contexts provide convienient a formalism to reason evaluation contexts, as they describe a computation that needs a term to proceed. However, iteration To generalize the induction hypothesis of Lemma D.11 sufficently requires the introduction of formal contexts describe the computation from the inside out, instead of the outside in.

Definition D.12 (Iteration contexts).

types, it proves convienient to describe iteration contexts types in terms of source language types, despite the fact that the contexts themselves are defined in terms of the target language. Furthermore, because Because of our universal usage of the asterisk type constructor notation, B^* , for pure source language

iteration does not necessarily yield pure types in the source language, we also must make a distinction between normal and pure context types. In addition we define a notation of iterated contexts types, analagous to iterated types in the source language.

Definition D.13 (Iteration context algebra).

$$\frac{E\{\mathsf{fst}\,e\} = e'}{e\{e\} \triangleq e} \, \mathsf{cag_bullet} \qquad \frac{E\{\mathsf{fst}\,e\} = e'}{E\{\mathsf{fst}\,\bullet\} \{e\} \triangleq e'} \, \mathsf{cag_fst} \qquad \frac{E\{\mathsf{snd}\,e\} = e'}{E\{\mathsf{snd}\,\bullet\} \{e\} \triangleq e'} \, \mathsf{cag_snd}$$

 $E\{\!\{ \bullet \ \overline{e'}\}\!\!\}\{e\}\!\!\!\} \triangleq e''$

 $E\{ee'\} \triangleq e''$

Definition D.14 (Context type algebra).

$$\overbrace{\bullet \{A\}} \triangleq A \text{ tag_bullet} \qquad \frac{C\{\!\!\{A\}\!\!\} \triangleq A''}{(C \times A')\{\!\!\{A\}\!\!\} \triangleq A'' \times A'} \text{ tag_prod_left} \qquad \overline{(A')}$$

ig_prod_left

Definition D.15 (Iterated context types).

 $A\langle D\times \overline{B\rangle}\triangleq C\times A\langle B\rangle \ \text{ctp_it_prod_left}$

 $A\langle D\rangle \triangleq C$

$$\frac{A\langle D\rangle \triangleq C}{A\langle B\times D\rangle \triangleq A\langle B\rangle\times C} \text{ ctp.it.prod.right}$$

Definition D.16 (Context typing rules).

$$\Delta; \Gamma \vdash_{\tau} E\{\!\!\{ \bullet \ e\}\!\!\} : A \to C$$

=

Finally, we define a formalism to describe the result of iteration over an iteration context.

Definition D.17 (Iterated contexts).

$$\frac{\Delta, \Gamma \vdash e_{\Theta} : \Sigma^* \tau \to \tau}{\Delta, \Gamma \vdash \bullet \blacktriangleright_{e_{\Theta}}^* \bullet} \text{ itc_bullet}$$

$$\frac{\Delta; \Gamma \vdash E \blacktriangleright_{e_{\Theta}}^{r} E'}{\Delta; \Gamma \vdash E\{\mathbf{fst} \bullet\} \blacktriangleright_{e_{\Theta}}^{r} E'\{\mathbf{fst} \bullet\}} \text{ itc_fst}$$

$$\frac{\Delta;\Gamma \vdash E \blacktriangleright_{c_{\Theta}}^{\tau} E'}{\Delta;\Gamma \vdash E\{\mathbf{snd}\bullet\} \blacktriangleright_{c_{\Theta}}^{\tau} E'\{\mathbf{snd}\bullet\}} \text{ itc_snd}$$

$$\begin{array}{ccc} \Delta; \Gamma \vdash E \blacktriangleright^{\tau}_{e_{\Theta}} E' & \Delta; \Gamma \vdash e : B^{*}(\operatorname{Rec} \Sigma^{*} \tau) \\ \hline \Delta; \Gamma \vdash E \{ \bullet \ e \} \blacktriangleright^{\tau}_{e_{\Theta}} E' \{ \bullet \ (\operatorname{openitor} \{\!\!\{B^{*}\!\!\} [\tau] \ e_{\Theta} \ e) \} \end{array} \right. \text{itc.app} \end{array}$$

Lemma D.18 (Iterated context typing). If $\Delta : \Gamma \vdash_{\tau} E : D$ and $\Delta \vdash_{\tau} A \bowtie_{\tau} A_{s}$ and $\Delta : \Gamma \vdash_{\Gamma} E \blacktriangleright_{c_{s}}^{\bullet} B'$ then $\Delta; \Gamma \vdash_{\tau} E' : A\langle D \rangle.$ *Proof.* By induction over the structure $\Delta; \Gamma \vdash_{\tau} E : D$.

The following two lemmas lift congruence to iteration contexts.

Lemma D.19 (Congruence under iteration contexts). If $\Delta; \Gamma \vdash_{\tau'} E : C$ and $\Delta; \Gamma \vdash e_1 \equiv_{\beta\eta} e_2 : C\{B\}^*\tau \text{ then } \Delta; \Gamma \vdash E\{e_1\} \equiv_{\beta\eta} E\{e_2\} : B^*\tau.$

Proof. By induction over the structure of $\Delta; \Gamma \vdash_{\tau} E : C$.

 $\Delta; \Gamma \vdash e_1 \equiv_{\beta\eta} e_2 : D\{B\}^* \tau_A \text{ and } \Delta \vdash A \rhd_\tau \tau_A \text{ then } \Delta; \Gamma \vdash E\{e_1\} \equiv_{\beta\eta} E\{e_2\} : B^* \tau_A.$ Lemma D.20 (Congruence under iterated contexts). If $\Delta; \Gamma \vdash_{\tau} E : A\langle D \rangle$ and

Proof. By induction over the structure of $\Delta; \Gamma \vdash_{\tau} E : A\langle B \rangle$.

12

Lemma D.21 (Lifting right inverse property to iteration contexts). If $\Delta: \Gamma \vdash e_{\Theta} : \Sigma^* \tau_A \to \tau_A$ and $\Delta; \Gamma \vdash \mathsf{openiter}\{B^*\}[\tau_A] \ e_\Theta(E\{\mathsf{uniter}\{\tilde{D}\{B\}^*\}[\tau_A] \ e_\Theta \ e'\}) \equiv_{\beta\eta} E'\{e'\}: B^*\tau_A \ \textit{where} \ \Delta; \Gamma \vdash E \blacktriangleright_{e,\Theta}^{\tau_A} E'.$ $\Delta; \Gamma \vdash_{\tau} E : D \text{ and for all } \Delta; \Gamma \vdash e' : D \{\!\!\{B\}\!\!\}^* \tau_A,$

Proof. We do this by induction on Δ ; $\Gamma \vdash_{\tau} E : D$.

Š

$$\overline{\Delta;\Gamma \vdash_{ au} \bullet : ullet}$$
 ctp_bullet

- Assume an arbitrary $\Delta; \Gamma \vdash e' : \bullet \{B\}^* \tau_A$.
- Given the syntactic equivalence for context bullet types (tag-bullet) on $\Delta; \Gamma \vdash e' : \bullet \{\!\!\{B\}\!\!\}^* \tau_A$, we can conclude $\Delta : \Gamma \vdash e' : B^* \tau_A$.
- $\Delta; \Gamma \vdash \mathbf{openiter} \{B^*\}[\tau_A] \ e_{\ominus} \ (\bullet \{\mathbf{uniter} \{B^*\}[\tau_A] \ e_{\ominus} \ e'\}) \equiv_{\beta\eta} \bullet \{e'\} : B^*\tau_A \ \text{follows from follows}$ $\Delta; \Gamma \vdash e_{\Theta} : \Sigma^* \tau_A \to \tau_A$, and congruence of application (eq.app) on $\Delta; \Gamma \vdash e' : B^* \tau_A$ gives us Using Lemma D.2 (properties of iteration, part 1), congruence of substitution (eq.subst) on $\Delta; \Gamma \vdash \mathbf{openiter}[B^*][\tau_A] e_{\Theta} \ (\mathbf{uniter}[B^*][\tau_A] e_{\Theta} \ e') \equiv_{\beta\eta} e' : B^*\tau_A \ \mathrm{The \ desired \ result}$
- From the rule for iterated bullet contexts (itc_bullet) and $\Delta; \Gamma \vdash e_{\Theta} : \Sigma^* \tau_A \to \tau_A$ we have that

from the syntatic equivalence for bullet iteration contexts (cag_bullet).

Case

$$\frac{\Delta; \Gamma \vdash_{\tau} E : D}{\Delta; \Gamma \vdash_{\tau} E \{ \text{fst} \bullet \} : D \times B_{1}} \text{ ctp_fst}$$

¹²Something here

- $\Delta; \Gamma \vdash e' : (D\{\!\!\{B\}\!\!\}^*\tau_A) \times (B_1^*\tau_A)$. Furthermore, by the typing rule for the first projection (tp-fst) Assume an arbitrary $\Delta; \Gamma \vdash e' : (D \times B_1) \{\!\!\{ B \}\!\!\}^* \tau_A$. From syntactic equivalence of product context types (tag_prod_left) and type equvialence (tp_eq) we have that we have that $\Delta; \Gamma \vdash \mathbf{fst} \ e' : D\{B\}^* \tau_A$.
- By application of the induction hypothesis to $\Delta; \Gamma \vdash e_{\Theta} : \Sigma^* \tau_A \to \tau_A$ and $\Delta; \Gamma \vdash_{\tau} E : D$ we have $\Delta; \Gamma \vdash \mathbf{openiter}\{B_2^*\}[\tau_A] =_{\Theta}(E\{\mathbf{uniter}\{D\{B_2\}^*\}[\tau_A] \in_{\Theta} e''\}) \equiv_{\beta\eta} E'\{e''\} : B_2^*\tau_A \text{ where } \Delta; \Gamma \vdash E \models_{\Theta}^{\tau_A} E'. \text{ We instantiate this derivation with } \Delta; \Gamma \vdash \mathbf{fst} e' : D\{B\}^*\tau_A \text{ allowing us to } E' \in_{\Theta}^{\tau_A} E' \in_{\Theta}^{\tau_A} E' = E' \in_{\Theta}^{\tau_A} E' \in_{\Theta}^{\tau_A} E' = E' \in_{\Theta}^{\tau_A} E' : E' \in_{\Theta}^{\tau_A} E' = E' \in_{$ that for all Δ ; $\Gamma \vdash e'' : D\{B_2\}^* \tau_A$,
- $\Delta; \Gamma \vdash e_{\Theta} : \Sigma^* \tau_A \to \tau_A \text{ and } \Delta; \Gamma \vdash e' : (D \{B\}^* \tau_A) \times (B_1^* \tau_A), \text{ and } \beta\text{-equivalence for products}$ From Lemma D.2 (properties of iteration, part 6), congruence of substitution (eq.subst) on $\Delta; \Gamma \vdash \mathbf{openiter} \{B^*\}[\tau_A] \ e_{\Theta}(E\{\mathbf{uniter} \{D\{B\}^*\}[\tau_A] \ e_{\Theta} \ \mathbf{fst} \ e'\}) \equiv_{\beta\eta} E'\{\mathbf{fst} \ e'\} : B^*\tau_A.$
 - (eq_pair_beta1) we have that

$$\Delta; \Gamma \vdash \mathbf{fst} (\mathbf{uniter} \{ \{ D \{ B \} \times B_1 \}^* \} [\tau_A] e_{\Theta} e') \equiv_{\beta\eta}$$

$$\mathbf{uniter} \{ D \{ B \}^* \} [\tau_A] e_{\Theta} \mathbf{fst} e' : D \{ B \}^* (\text{Rec } \Sigma^* \tau_A)$$

Using Lemma D.19 (congruence for iteration contexts) on $\Delta; \Gamma \vdash_{\tau} E : D$ we can conclude

$$\begin{array}{l} \Delta; \Gamma \vdash E \big\{ \text{fst (uniter} \{ (D\{B\} \times B_1)^* \} [\tau_A] \ e_{\Theta} \ e' \rangle \big\} \equiv_{\beta\eta} \\ E \big\{ \text{uniter} \{ D\{B\}^* \} [\tau_A] \ e_{\Theta} \ \text{fst } e' \} : B^* (\text{Rec } \Sigma^* \ \tau_A) \end{array}$$

Using this equivalence along with the congruence of application (eq.app) and transitivity (eq_trans) we can conclude

$$\Delta; \Gamma \vdash \mathbf{openiter}\{B^*\}[\tau_A] \ e_{\Theta}(E\{\{\mathbf{fst}\ (\mathbf{uniter}\{\{(D\{B\}\times B_1)^*\}[\tau_A]\ e_{\Theta}\ e'\}\}\}) \equiv \beta\eta, E'\{\{\mathbf{fst}\,e'\}: B^*\tau_A\}$$

Finally using the syntactic equivalence of projection iteration contexts (cag_fst) and the syntactic equivalence of context product types we have the desired result

$$\begin{array}{l} \Delta; \Gamma \vdash \mathbf{openitor}\{B^*\}[\tau_A] \in_{\Theta}(E\{\mathbf{fst}\bullet\}\{\{\mathbf{uniter}\{(D\times B_1)\{B\}^*\}[\tau_A] \in_{\Theta}e')\}\}) \equiv_{\beta\eta} \\ E'\{\mathbf{fst}\bullet\}\{e'\}:B^*\tau_A \end{array}$$

Given that $\Delta; \Gamma \vdash E \triangleright_{e,\Theta}^{T_A} E'$ we can conclude $\Delta; \Gamma \vdash E\{\{\mathbf{st} \bullet\}\} \triangleright_{e,\Theta}^{T_A} E'\{\{\mathbf{st} \bullet\}\}\}$ by the rule for iterated projection contexts (itc_fst).

Case The case for ctp_snd is symmetric to ctp_fst.

Case

$$\frac{\Delta, \Gamma \vdash_{\tau} E \colon D \quad \Delta \vdash B_1 \rhd_{\tau} \tau_B \quad \Delta, \Gamma \vdash e \colon \tau_B}{\Delta, \Gamma \vdash_{\tau} E \{ \bullet e \} \colon B_1 \to D} \text{ ctp app}$$

- Assume an arbitrary $\Delta : \Gamma \vdash e' : (B_1 \to D) \{\!\!\{ B \}\!\!\}^* \gamma_A$. Using the rule for syntactic equivalence of context function types $(\mathsf{tag_arrow})$ and type equivalence $(\mathsf{tp_eq})$ we know that $\Delta; \Gamma \vdash e' : (B_1^* \tau_A) \to (D \{\!\{B\}\!\}^* \tau_A).$
- application (tp_tapp, tp_app) we can conclude $\Delta; \Gamma \vdash \mathbf{openiter}[B_1^*][\tau_A] \in_{\Theta} e : B_1^*\tau_A$. Finally by we can conclude that $\Delta \vdash \tau_B \equiv \beta_\eta B_1^*(\text{Rec } \Sigma^* \tau_A) : \star$. Therefore, by type equivalence (eq.tp) we have that $\Delta \colon \Gamma \vdash e : B_1^*(\text{Rec } \Sigma^* \tau_A)$. Consequently, using the typing rules for type and term From Lemma C.16 (commutativity for parameterization and type encoding) on $\Delta \vdash B_1 \rhd_{\tau} \tau_B$ using the typing rule for application on $\Delta; \Gamma \vdash e' : (B_1^*\tau_A) \to (D\{B\}^*\tau_A)$ we have that $\Delta; \Gamma \vdash e'(\mathbf{openiter}\{B_1^*\}[\tau_A] \ e_{\Theta} \ e) : D\{B\}^*\tau_A.$

76

By application of the induction hypothesis to $\Delta; \Gamma \vdash e_{\Theta} : \Sigma^*\tau \to \tau_A$ and $\Delta; \Gamma \vdash_{\tau} E : D$ we know that for all Δ ; $\Gamma \vdash e'' : D\{B_2\}^* \tau_A$, $\Delta; \Gamma \vdash \text{openiter}\{B_2^*\}[\tau_A] \ e_{\Theta}(E\{\text{uniter}\{D\{B_2\}^*\}[\tau_A] \ e_{\Theta} \ e''\}) \equiv_{\beta\eta} E'\{e''\} : B_2^*\tau_A \ \text{where}$ $\Delta; \Gamma \vdash E \triangleright_{e\Theta}^{T_A} E'$. By instantiating this derivation with

$$\Delta : \Gamma \vdash E \not\models_{e,d}^A E'$$
. By instantiating this derivation with $\Delta : \Gamma \vdash e'(\mathbf{openiter}\{B_1^*\}_{1}^*\Gamma_{7A}] \in e, e) : D\{B\}^*\tau_A$ we have a derivation

$$\Delta; \Gamma \vdash \mathbf{openiter}\{B^*\}[\tau_A] \ e_{\Theta}(E\{\mathbf{uniter}\{D\{B\}^*\}[\tau_A] \ e_{\Theta} \ (e'(\mathbf{openiter}\{B_1^*\}[\tau_A] \ e_{\Theta} \ e))\})) \equiv_{\beta\eta} E'\{e'(\mathbf{openiter}\{B_1^*\}[\tau_A] \ e_{\Theta} \ e)\} : B^*\tau_A$$

From Lemma D.2 (properties of iteration, part 4), congruence of substitution (eq.subst) on (eq_app), and β -equivalence for abstractions (eq_abs_beta), and the syntactic quivalence of $\Delta; \Gamma \vdash e_{\Theta} : \Sigma^* \tau \to \tau_A \text{ and } \Delta; \Gamma \vdash e' : (B_1^* \tau_A) \to (D \{\!\!\{B\}\!\!\}^* \tau_A), \text{ congruence for application}$ context function types (tag_arrow) we have that

$$\Delta; \Gamma \vdash (\mathbf{uniter}\{(B_1 \to D)\{B\}^* | [\tau_A] \ f \ e')e \equiv \beta \eta \\ \mathbf{uniter}\{D\{B\}^* | [\tau_A] \ e_\Theta \ (e'(\mathbf{openiter}\{B\}^* | [\tau_A] \ e_\Theta \ e)) : D\{B\}^* (\mathsf{Rec} \ \Sigma^* \ \tau_A) \\ \end{pmatrix}$$

From this congruence, Lemma D.19 (congruence for iteration contexts) on Δ ; $\Gamma \vdash_{\tau} E : D$, and congruence on application (eq_app) we can conclude

$$\Delta; \Gamma \vdash \mathbf{openiter}\{B^*\}[\tau_A] \ e_\Theta(E\{\{\mathbf{uniter}\{\{(B_1 \to D)\{B\}^*\}[\tau_A] \ f \ e'\}e\}\}) \equiv_{\beta\eta}$$

 $E' \{\!\{e'(\mathbf{openiter} \{\!\{B_1^*\}\!\}[au_A] \; e_\Theta \; e)\}\!\} : B^* au_A$

Using our algebra on iteration contexts, we can pull out the applications (cag_app) to produce

$$\Delta; \Gamma \vdash \mathbf{openiter}\{B^*\}[\tau_A] \ e_{\Theta}(E\{\bullet \ e\}\{\mathbf{uniter}\{(B_1 \to D)\{B\}^*\}[\tau_A] \ f \ e'\}) \equiv_{\beta\eta} E'\{\bullet \ (\mathbf{openiter}\{B_1^*\}[\tau_A] \ e_{\Theta} \ e)\}\{e'\} : B^*\tau_A$$

$$E'\{\!\{ullet$$
 (openiter $\{B_1^*\}\!$ [au_A] $\{e,b\}$: $B^* au_A$

 $\Delta; \Gamma \vdash e : B_1^*(\mathsf{Rec}\ \check{\Sigma}^*\ \tau_A) \text{ we can conclude } \Delta; \Gamma \vdash E\{\bullet\ e\}\} \blacktriangleright_{e,\Theta}^{\tau_A} E'\{\bullet\ (\mathbf{openiter}\{B_1^*\}[\tau_A]\ e_\Theta\ e)\}.$ From $\Delta; \Gamma \vdash E \triangleright_{e_{\Theta}}^{\tau_A} E'$ and the rule for iterated application contexts (itc_app) on

Lemma D.22 (Iteration and atomic forms). If $\Psi \vdash V \downarrow B_2$ and $\Delta \vdash \Omega \rhd \Gamma_1$ and $\Delta \vdash \Upsilon \rhd_\tau \Gamma_2$ and

 $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter} \{\!\{B^*\}\!\} [\tau_A] \ e_\Theta \ E\{\!\{S(e)\}\!\} \equiv_{\beta\eta} E'\{\mathbf{openiter} \{\!\{D\{B\}\}\!\}\!\} [\tau_A] \ e_\Theta \ S(e)\}\!\} : B^*\tau_A \ where$ $\Delta \vdash A \rhd_{\tau} \tau_{A} \ and \ \Delta ; \Gamma_{1} \uplus \Gamma_{2} \vdash e_{\Theta} : \Sigma^{*} \tau_{A} \to \tau_{A} \ and \ \Omega ; \Upsilon \vdash \Theta : A \langle \Psi ; \Sigma \rangle \ and \ \Delta ; \varnothing \vdash V \rhd_{\tau_{A}} e \ and$ $\Delta, \Psi; \Theta; e_{\Theta} \blacktriangleright_{\tau^A}^{\tau_A} S \text{ then for all } \Delta; \Gamma_1 \uplus \Gamma_2 \vdash_{\tau} E : D \text{ where } B_2 = D\{B\}$

Proof. By induction on $\Psi \vdash V \downarrow B_2$.

$$\frac{\Psi(x) = B_2}{\Psi \vdash x \downarrow B_2} \text{ at_var}$$

Assume an arbitrary Δ ; $\Gamma_1 \uplus \Gamma_2 \vdash_{\tau} E : D$, where $B_2 = D\{B\}$.

- By inversion on $\Delta : \varnothing \vdash x \rhd_{\tau} e$ we have that e = x. Furthermore, given that $\Psi(x) = B_2 = D\{B\}$ and $\Delta; \Psi; \Theta; e_{\Theta} \blacktriangleright_{\tau^A}^{\tau_A} S$ using Lemma D.7 (substitution elimination) we can conclude $S(x) = \mathbf{uniter} \{D\{B\}^*\}[\tau_A] \ e_{\Theta} \ e'' \ \text{where} \ \Delta; \varnothing \vdash \Theta(x) \rhd_{\tau} e''.$
 - $A\langle D\{\!\!\{B\}\!\!\}\rangle$ and Lemma C.16 (commutativity for parameterization and type encoding) we have conclude Ω ; $\Upsilon \vdash \Theta(x) : A\langle D\{B\} \rangle$. Using Lemma C.11 (type encoding total and decidable) on From Lemma D.5 (typing for elimination) on $\Psi \vdash x \downarrow D \{B\}$ and $\Omega; \Upsilon \vdash \Theta : A \langle \Psi; \Sigma \rangle$ we can

derviation $\Delta \vdash A\langle D\{B\}\rangle \triangleright_{\tau} \tau_C$ where $\Delta \vdash \tau_C \equiv_{\beta\eta} D\{B\}^* \tau_A : \star$.

- Furthermore, given $\Delta \vdash \tau_C \equiv_{\beta\eta} D\{\!\!\{B\}\!\!\}^* \tau_A : \star$ we know that $\Delta : \Gamma_1 \uplus \Gamma_2 \vdash e'' : D\{\!\!\{B\}\!\!\}^* \tau_A$ by type $\Delta \vdash A\langle D\{B\} \rangle \rhd_{\tau} \tau_{C} \text{ and } \Omega; \Upsilon \vdash \Theta(x) : A\langle D\{B\} \rangle, \text{ we can conclude that } \Delta; \Gamma_{1} \uplus \Gamma_{2} \vdash e'' : \tau_{C}.$ Using Theorem C.2 (static correctness, forward direction) on $\Delta; \varnothing \vdash \Theta(x) \rhd_{\tau} e''$, with the auxilary judgements, $\Delta; \varnothing \vdash x \rhd_{\tau_A} x$ and $\Delta \vdash \Upsilon \rhd \Gamma_1$ and $\Delta \vdash \Omega \rhd_{\tau} \Gamma_2$ and
- From Lemma D.21 (lifting right inverse) on $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e_{\Theta} : \Sigma^* \tau_A \to \tau_A$ and $\Delta; \Gamma_1 \oplus \Gamma_2 \vdash_{\tau} E : D$ we have that for all $\Delta; \Gamma_1 \oplus \tilde{\Gamma}_2 \vdash \vec{e'} : D\{B_1\}^*\tau_A$,

 $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter}\{B_1^*\}[\tau_A] \in_{\Theta}(E\{\mathbf{uniter}\{D\{B_1\}^*\}[\tau_A] \in_{\Theta} e'\}) \equiv_{\beta\eta} E'\{e'\} : B_1^*\tau, \text{ where } A' \in_{\Psi} E'\}$ $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash E \triangleright_{e,e}^{\tau_A} E'$. If we instantiate this derivation with $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e'' : D\{B\}^* \tau_A$ we

have that

Given Lemma D.18 (iterated context typing) on Δ ; $\Gamma_1 \uplus \Gamma_2 \vdash_{\tau} E : D$ and Δ ; $\Gamma_1 \uplus \Gamma_2 \vdash E \blacktriangleright_{e_{\Theta}}^{r_A} E'$ $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter} \{B^*\}[\tau_A] \ e_{\Theta}(E\{\mathbf{uniter} \{D\{B\}^*\}[\tau_A] \ e_{\Theta} \ e''\}) \equiv_{\beta\eta} E'\{e''\} : B^*\tau_A.$

and $\Delta \vdash A \rhd_{\tau} \tau_A$ we know that $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash_{\tau} E' : A\langle D \rangle$.

From Lemma D.2 (properties of iteration, part 1), congruence of substition (eq_subst) on

 $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e_{\Theta} : \Sigma^* \tau_A \to \tau_A$, congruence for application (eq.app) on $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e'' : D\{B\}^* \tau_A$, and β -equivalence for abstractions (eq.abs.beta), we can conclude that $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e'' \equiv_{\beta_1}$ openiter $\{D\{B\}^*\}[\tau_A] \in_{\Theta}$ (uniter $\{D\{B\}^*\}[\tau_A] \in_{\Theta} e''\}: D\{B\}^* \tau_A$. This equivalence with Lemma D.20 (congruence for iterated contexts) on

 $\Delta; \Gamma_1 \oplus \Gamma_2 \vdash_{\tau} E' : A\langle D \rangle \text{ and } \Delta \vdash A \vdash_{\tau} \tau_A \text{ gives us} \\ \Delta; \Gamma_1 \oplus \Gamma_2 \vdash_{E} E' = \beta_{\eta} E' \{ \text{openiter} \{D\{B\}^* \} [\tau_A] \in_{\Theta} (\text{uniter} \{D\{B\}^* \} [\tau_A] \in_{\Theta} e'') \} : B^*\tau_A. \\ \text{Rolling the substitution } S = \text{uniter} \{D\{B\}^* \} [\tau_A] \in_{\Theta} e'' \text{ back up gives us that} \\ \Delta; \Gamma_1 \oplus \Gamma_2 \vdash_{E} E' \{e'' \} \equiv_{\beta_{\eta}} E' \{ \text{openiter} \{D\{B\}^* \} [\tau_A] \in_{\Theta} S(x) \} : B^*\tau_A. \text{ Using transitivity} \\ (\text{eq.trans}) \text{ on } \Delta; \Gamma_1 \oplus \Gamma_2 \vdash_{E} \{e'' \} \equiv_{\beta_{\eta}} E' \{ \text{openiter} \{D\{B\}^* \} [\tau_A] \in_{\Theta} S(x) \} : B^*\tau_A \text{ and rolling}$ up S(x) we can conclude the desired result

 $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter} \{B^*\}[\tau_A] \ e_{\Theta}(E\{S(x)\}) \equiv_{\beta\eta} E'\{\mathbf{openiter} \{D\{B\}^*\}[\tau_A] \ e_{\Theta} \ S(x)\} : B^*\tau_A.$

$$\frac{\Sigma(c)=B_2\to b}{\Psi\vdash c\downarrow B_2\to b} \text{ at_cons}$$

- $B_2 \to b = B_2 \to (D_1 \{\!\!\{B\}\!\!\})$ we know that $D_1 \{\!\!\{B\}\!\!\} = b$. By inversion, this means that $D_1 = \bullet$ and $B_2 \to b = D\{B\}$ we know that $D = B_2 \to D_1$ for some D_1 . Therefore by syntactic equality for context function types (tag arrow) we know that $D\{B\} = B_2 \to (D_1\{B\})$. Given that Assume an arbitrary $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash_{\tau} E : D$ where $B_2 \to b = D\{B\}$. By inversion on B = b. Consequently, $D = B_2 \to \bullet$.
 - $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash_{\tau} E_1 : \bullet \text{ and } \Delta \vdash B_2 \rhd_{\tau} \tau_B \text{ and } \Delta; \Gamma_1 \uplus \Gamma_2 \vdash e' : \tau_B.$ Furthermore, by inversion on Using inversion on $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash_{\tau} E : B_2 \to \bullet$ we know that $E = E_1 \{\!\{\bullet e^{\prime}\}\!\}$ where $\Delta; \Gamma_1 \oplus \Gamma_2 \vdash_{\tau} E_1 : \bullet \text{ we know that } E_1 = \bullet. \text{ Consequently, } E = \bullet \{ \bullet e' \}.$

- From inversion on $\Delta : \varnothing \vdash c \rhd_{\tau_A} e$ we know that $e = \lambda x : \tau_B.\mathbf{roll}[\tau_A](\mathbf{inj}_{\mathcal{L}(c)} x \mathbf{of} \Sigma^*(\mathsf{Rec} \Sigma^* \tau_A))$. From Lemma C.16 (commutativity for parameterization and type encoding) on $\Delta \vdash B_2 \rhd_{\tau} \tau_B$
 - we can conclude that $\Delta \vdash \tau_B \equiv_{\beta\eta} B_2^*(\mathsf{Rec}\ \Sigma^*\ \tau_A) : \star$. Using this congruence with type equivalence (eq_tp) gives us Δ ; $\Gamma_1 \uplus \Gamma_2 \vdash e' : B_2^*(\text{Rec } \Sigma^* \tau_A)$.
- By Lemma D.2 (properties of iteration, part 7), and congruence of substitution (eq_subst) on $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e' : B_2^*(\mathsf{Rec}\ \Sigma^*\ \tau_A) \text{ and } \Delta; \Gamma_1 \uplus \Gamma_2 \vdash e_\Theta : \Sigma^*\tau_A \to \tau_A \text{ we can conclude}$

$$\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter} \{\Sigma^*\} [\tau_A] \in_{\Theta} (\mathbf{inj}_{\mathcal{L}(c)}) \in_{V} \mathbf{of} \Sigma^* \tau_A) \equiv_{\beta\eta}$$
$$\mathbf{inj}_{\mathcal{L}(c)} (\mathbf{openiter} \{B_2^*\} [\tau_A] \in_{\Theta} e') \mathbf{of} \Sigma^* \tau_A : \Sigma^* \tau_A$$

By congruence of application (eq.app) on Δ ; $\Gamma_1 \uplus \Gamma_2 \vdash e_{\Theta} : \Sigma^* \tau_A \to \tau_A$, rolling up the definition of **roll**, and β -equivalence (eq_abs_beta) gives

1/2-equivalence (eq.abs_beta) gives
$$\Delta; \Gamma_1 \uplus \Gamma_2 \vdash ((\lambda x : \tau_B.\mathbf{roll}[\tau_A](\mathbf{inj}_{\mathcal{L}(c)} x \mathbf{of} \Sigma^*(\mathsf{Rec} \Sigma^* \tau_A)))e')e_{\Theta} \equiv_{\beta\eta}$$
$$e_{\Theta}(\mathbf{inj}_{\mathcal{L}(c)} (\mathbf{openiter}\{\{B_2^*\}[\tau_A] e_{\Theta} e') \mathbf{of} \Sigma^*\tau_A) : \tau_A$$

By Lemma D.2 (properties of iteration, part 2) and β -equivalence again we have that

$$\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter}\{\|b^*\|[\tau_A] \in \Theta \ ((\lambda x : \tau_B.\mathbf{rol}[[\tau_A](\mathbf{inj}_{\mathcal{L}(c)} x \ \mathbf{of} \ \Sigma^*(\mathsf{Rec} \ \Sigma^* \ \tau_A))))e') \equiv_{\beta\eta} \\ (\lambda x : B_2^*\tau_A \cdot e_{\Theta}(\mathbf{inj}_{\mathcal{L}(c)} x \ \mathbf{of} \ \Sigma^*\tau_A))(\mathbf{openiter}\{\|B_2^*\|[\tau_A] \ e_{\Theta} \ e') : b^*\tau_A$$

Again using Lemma D.2 (properties of iteration, part 8), with congruence of subsitution on $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e_{\Theta} : \Sigma^* \tau_A \to \tau_A$, congruence of application, and rolling up $e = \lambda x : \tau_B.\mathbf{roll}[\tau_A](\mathbf{inj}_{\mathcal{L}(c)} x \mathbf{of} \Sigma^*(\mathsf{Rec} \Sigma^* \tau_A))$ we can conclude

$$\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter}\{b^* \| [\tau_A] \in \ominus (ee') \equiv \beta \eta$$
 (openiter $\{B_3 \mapsto b^* \} [\tau_A] \in \ominus (\mathbf{openiter}\{B_3 \mapsto b^* \} [\tau_A])$

$$\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter} \{b^*\}[\tau_A] \in_{\Theta} (ee') \equiv_{\beta\eta}$$
 (openiter $\{B_2^*\}[\tau_A] \in_{\Theta} e' : b^*\tau_A$

If we use the syntactic equivalence of bullet and application contexts (cag_bullet,cag_app) we have the desired result.

$$\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter} \{b^*\}[\tau_A] e_{\Theta} (\bullet \{\bullet e'\} \{e_{B}\}) \equiv \beta_{\eta} \\ \bullet \{\bullet (\mathbf{openiter} \{B_{2}^*\} [\tau_A] e_{\Theta} e') \} \{\mathbf{openiter} \{(B_2 \to \bullet) \{b\}^*\} [\tau_A] e_{\Theta} e\} : b^* \tau_A$$

It follows from the rule for iterated bullets and application (itc_bullet, itc_app) on $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e' : B_2^*(\mathsf{Rec} \Sigma^* \tau_A)$ we can conclude that where $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \bullet \{\bullet e'\} \blacktriangleright_{e_\Theta}^{\tau_A} \bullet \{\!\!\{\bullet \text{ (openiter}\{B_2^*\}[\tau_A] e_\Theta e')\}\!\!\}.$

Case

$$\Psi \vdash V_1 \downarrow B_1 \to B_2 \quad \Psi \vdash V_2 \Uparrow B_1$$
 at app
$$\Psi \vdash V_1 V_2 \downarrow B_2$$

- Assume an arbitrary $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash_{\tau} E : D$ where $B_2 = D \{B\}$.
- From typing of atomic and canonical forms[24] on $\Psi \vdash V_2 \uparrow \!\!\!\!\!/ B_1$ we can conclude $\varnothing \colon \Psi \vdash V_2 : B_1$. By inversion on Δ ; $\varnothing \vdash V_1V_2 \rhd_{\tau_A} e$ we have that $e = e_1'e_2'$ where Δ ; $\varnothing \vdash V_1 \rhd_{\tau_A} e_1'$ and
- By Lemma C.11 (type encoding total and decidable) we know that $\Delta \vdash B_1 \rhd_\tau \tau_B$. Using Lemma D.8 (static correctness with substitution) on on $\Delta; \varnothing \vdash V_2 \rhd_{\tau_A} e_2'$ and $\Delta \vdash B_1 \rhd_{\tau_A} T_B$ and $\Psi \vdash V_2 \uparrow B_1$ and $\Delta; \Psi; \Theta; e_{\Theta} \blacktriangleright_{\tau^A} S$ gives us a derivation $\Delta; \varnothing \vdash S(e_2') : \tau_B$. Using Lemma C.16 (commutativity for parameterization and type encoding), weakening, and type equivalence (tp_eq) we know that Δ ; $\Gamma_1 \oplus \Gamma_2 \vdash S(e_2') : B_1^*(\text{Rec } \Sigma^* \tau_A)$.
- Using the context typing rule for application (ctp_app) on $\Delta; \Gamma_1 \oplus \Gamma_2 \vdash_{\tau} E : D$ and $\Delta \vdash B_1 \rhd_{\tau_A} \tau_B$ and and $\Delta; \Gamma_1 \uplus \Gamma_1 \vdash S(e_2') : B_1^*(\mathsf{Rec}\ \Sigma^*\ \tau_A)$ we have that

 $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash_{\tau} E\{\bullet S(e_2')\}\} : B_1 \to D.$

- Appealing to the induction hypothesis on $\Psi \vdash V_1 \downarrow B_1 \to B_2$, with the auxiliary judgements $\Delta \vdash \Omega \rhd \Gamma_1$ and $\Delta \vdash \Upsilon \rhd_\tau \Gamma_2$ and $\Delta \vdash A \rhd_\tau \tau_A$ and $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e_\Theta : \Sigma^* \tau_A \to \tau_A$ and $\Omega; \Upsilon \vdash \Theta : A\langle \Psi; \Sigma \rangle \text{ and } \Delta; \varnothing \vdash V_1 \rhd_{\tau_A} e_1' \text{ and }$
- $\Delta, \Psi; \Theta; e_{\Theta} \blacktriangleright_{T^A}^* S$, allows us to conclude for all $\Delta; \Gamma_1 \oplus \Gamma_2 \vdash_{\tau} E_1 : D_1$ where $B_1 \to B_2 = D_1\{B_3\}$, $\Delta; \Gamma_1 \oplus \Gamma_2 \vdash_{\Theta} \mathbf{openiter}\{B_1\}^* \}[\tau_A] e_{\Theta} S(e_1)\} = \beta_n \Gamma_1^* \{\mathbf{openiter}\{D_1\{B_3\}^*\} [\tau_A] e_{\Theta} S(e_1)\} : B_3^* \tau_A$ where $\Delta; \Gamma_1 \oplus \Gamma_2 \vdash_{E} E_1 \blacktriangleright_{e_0} E_1^*$. If we instantiate this derivation with $\Delta; \Gamma_1 \oplus \Gamma_2 \vdash_{\tau} E_1 \oplus S(e_2^*)\} : B_1 \to D$ and B, we have

$$\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter} \{B^*\}[\tau_A] \in_{\Theta} E\{\bullet S(e_2')\} \{\{S(e_1')\} \equiv_{\beta\eta} E'\{\bullet (\mathbf{openiter} \{B^*\}[\tau_A] \in_{\Theta} S(e_2'))\} \{\{\mathbf{openiter} \{\{B_1 \to D\} \{B\}^*\}[\tau_A] \in_{\Theta} S(e_1')\} : B^*\tau_A \in_{\Theta} E'\{\bullet (\mathbf{openiter} \{B_1 \to B'\} \{T_A\} \in_{\Theta} S(e_1')\} : B^*\tau_A \in_{\Theta} E'\{\bullet (\mathbf{openiter} \{B_1 \to B'\} \{T_A\} \in_{\Theta} S(e_1')\} : B^*\tau_A \in_{\Theta} E'\{\bullet (\mathbf{openiter} \{B_1 \to B'\} \{T_A\} \in_{\Theta} S(e_1')\} : B^*\tau_A \in_{\Theta} E'\{\bullet (\mathbf{openiter} \{B_1 \to B'\} \{T_A\} \in_{\Theta} S(e_2')\} \} = 0$$

syntactic equivalence of application contexts (cag.app) and the definition of substitution we can where Δ ; $\Gamma_1 \uplus \Gamma_2 \vdash E\{\{\bullet\}\}\} \blacktriangleright_{e_\Theta}^{A} E'\{\{\bullet\}\}\}$ (openiter $\{B_1^*\}[T_A] \in S(e_2')\}$). If we use the

$$\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter} \{B^*\}_{[\mathcal{I}_A]} \in_{\mathcal{B}} E\{S(e_1'e_2')\} \equiv_{\beta\eta} E' \{(\mathbf{openiter}_{\{B^*\}}, [\mathcal{I}_A] \in_{\mathcal{B}} D) \{B^*\}_{[\mathcal{I}_A]} \in_{\mathcal{B}} S(e_1')) (\mathbf{openiter}_{\{B^*\}}, [\mathcal{I}_A] \in_{\mathcal{B}} S(e_2')) \}: B^*\tau_A$$

- Given Lemma D.18 (iterated context typing) on Δ ; $\Gamma_1 \oplus \Gamma_2 \vdash_{\tau} E : D$ and Δ ; $\Gamma_1 \oplus \Gamma_2 \vdash_{E} F \models_{e,a}^{\tau} E'$ By inversion on Δ ; $\Gamma_1 \oplus \Gamma_2 \vdash E\{\{\bullet\}\}\} \triangleright_{e,\ominus}^{\tau_A} E'\{\{\bullet\}\}$ (openiter $\{B_1^*\}[\tau_A] \in S(e_2')\}\}$ we have that Δ ; $\Gamma_1 \uplus \Gamma_2 \vdash E \blacktriangleright_{e_{\Theta}}^{\tau_A} E'$
 - and and $\Delta \vdash A \rhd_{\tau} \tau_A$ we know that $\Delta : \Gamma_1 \uplus \Gamma_2 \vdash_{\tau} E' : A\langle D \rangle$.
- If we instantiate for all $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash_{\tau} E_1 : D_1$ where $B_1 \to b = D_1 \{B_3\}$,
- $\Delta; \Gamma_1 \oplus \Gamma_2 \vdash \mathbf{openiter} \{B_3^*\}[\tau_A] \in B_1\{S(e_1')\} \equiv \beta_\eta E_1'\{\mathbf{openiter} \{D_1 \{B_3\}^*\}[\tau_A] \in S(e_1')\} : B_3^* \tau_A$ where $\Delta; \Gamma_1 \oplus \Gamma_2 \vdash E_1 \blacktriangleright_{e_0}^{\tau_A} E_1'$ with $\Delta; \Gamma_1 \oplus \Gamma_2 \vdash_{\tau} \bullet \{\bullet S(e_2')\} : B_1 \to \bullet$ and $D\{B\}$, we have
- $\begin{array}{l} \operatorname{openiter} [D\{B\}^*][\tau_A] \in_{\Theta} \left(\bullet \{ \bullet S(e_2') \} \{ S(e_1') \} \right) \equiv_{\beta\eta} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \{ \operatorname{openiter} \{ (B_1 \to \bullet) \{ D\{B\} \}^* \} [\tau_A] \in_{\Theta} S(e_1') \} : D\{B\}^* \tau_A \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \{ \operatorname{openiter} \{ (B_1 \to \bullet) \{ B_1^* \} \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_1^* \} [\tau_A] \in_{\Theta} S(e_2') \} \} \} \\ \bullet \{ \bullet \left(\operatorname{openiter} \{ B_$
 - where $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \bullet \{\!\!\{\bullet\}(e_2')\}\!\!\} \triangleright_{\bullet,\ominus}^{\tau_A} \bullet \{\!\!\{\bullet\}(\mathbf{openiter}\{B_1^*\}[\tau_A] e_\ominus S(e_2'))\}\!\!\}$. Again, if we use the

syntactic equivalence of application contexts and the definition of substitution we can conclude

 $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter} \{D \{B\}^*\} [\tau_A] \ e_\Theta \ S(e_1' e_2') \equiv_{\beta\eta}$

 $(\mathbf{openiter} \{\!\{(B_1 \to D) \{\!\!\{B\}\!\!\}^*\}\!\![\tau_{A}]} \stackrel{.}{e_{\Theta}} S(e_1')) (\mathbf{openiter} \{\!\!\{B_1^*\}\!\!\} [\tau_{A}]} e_{\Theta} S(e_2')) : D \{\!\!\{B\}\!\!\}^* \tau_{A}$

Using Lemma D.19 (congruence of iterated contexts) on $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash_{\tau} E' : A\langle D \rangle$ and $\Delta \vdash A \rhd_{\tau} \tau_{A}$ we can conclude

$$\Delta; \Gamma_1 \oplus \Gamma_2 \vdash E' \{ \mathbf{openiter} \{ D_1 \{ B_2 \}^* \} [\tau_A] \in \mathcal{S}(e_1'e_2') \} \equiv \beta_\eta$$

$$E' \{ (\mathbf{openiter} \{ \{ B_1 \to D \} \{ D \}^* \} [\tau_A] \in \mathcal{S}(e_1')) ((\mathbf{openiter} \{ B_1^* \} [\tau_A] \in \mathcal{S}(e_2')) \} : B^*\tau_A \}$$

Using this equivalence along with transitivity (eq_trans) and

$$\Delta ; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter} \{\!\!\{ B^* \} [\tau_A] e_\Theta \ E_A^{\{\!\!\{} \{e_1'e_2'\} \} \!\!\} \equiv_{\beta\eta} \\ E'_{\{\{\mathbf{openiter} \{\!\!\{ B_1 \to D \} \{\!\!\} B^* \}\!\!\} [\tau_A] e_\Theta \ S(e_1'))} (\mathbf{openiter} \{\!\!\{ B^* \}\!\!\} [\tau_A] e_\Theta \ S(e_2')) \} : B^*\tau_A$$

we have the desired result

$$\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter} \{B^*\} [\tau_A] \ e_\Theta \ E \{S(e_1'e_2')\} \equiv \beta_\eta$$

$$E' \{\mathbf{openiter} \{D\{B_2\}^*\} [\tau_A] \ e_\Theta \ S(e_1'e_2')\} : B^*\tau_A$$

Case

$$\frac{\Psi \vdash V \downarrow B_2 \times B_1}{\Psi \vdash \mathbf{fst} \, V \downarrow B_2} \text{ at_fst}$$

- Assume an arbitrary Δ ; $\Gamma_1 \uplus \Gamma_2 \vdash_{\tau} E : D$ where $B_2 = D\{B\}$. Using the context typing rule for projection (ctp_fst) we can conclude $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash_{\tau} E\{ \mathbf{fst} \bullet \} : D \times B_1$.
- Using inversion on $\Delta; \varnothing \vdash \mathbf{fst} \ V \rhd_{\tau_A} e$ we can conclude $\Delta; \varnothing \vdash V \rhd_{\tau_A} e'$ where $e = \mathbf{fst} \ e'$.
- Appealing to the induction hypothesis on $\Psi \vdash V \downarrow B_2 \times B_1$, with the auxiliary judgements $\Delta; \Psi; \Theta; e_{\Theta} \triangleright_{\tau}^{\tau_A} S$, we then have forall, $\Delta; \Gamma_1 \oplus \Gamma_2 \vdash_{\tau} E_1 : D_1$ where $B_2 \times B_1 = D_1 \{B_3\}$, $\Delta \vdash \Omega \rhd \Gamma_1$ and $\Delta \vdash \Upsilon \rhd_\tau \Gamma_2$ and $\Delta \vdash A \rhd_\tau \tau_A$ and $\Delta ; \Gamma_1 \uplus \Gamma_2 \vdash e_\Theta : \Sigma^* \tau_A \to \tau_A$ and $\Omega; \Upsilon \vdash \Theta : A\langle \Psi, \Sigma \rangle \text{ and } \Delta \vdash \Omega \rhd \Gamma_1 \text{ and } \Delta \vdash \Upsilon \rhd_\tau \Gamma_2 \text{ and } \Delta; \varnothing \vdash V \rhd_{\tau_A} e' \text{ and }$

where $\triangle_1\Gamma_1 \oplus \Gamma_2 \vdash E\{\mathbf{fst} \bullet\} \blacktriangleright_{c_0}^{\mathsf{rd}} E'\{\mathbf{fst} \bullet\}$. By inversion on $\triangle_1\Gamma_1 \oplus \Gamma_2 \vdash E\{\mathbf{fst} \bullet\} \blacktriangleright_{c_0}^{\mathsf{rd}} E'\{\mathbf{fst} \bullet\}$ we can conclude $\triangle_1\Gamma_1 \oplus \Gamma_2 \vdash E \blacktriangleright_{c_0}^{\mathsf{rd}} E'$

- Given Lemma D.18 (iterated context typing) on $\Delta : \Gamma_1 \oplus \Gamma_2 \vdash_{\tau} E : D$ and $\Delta : \Gamma_1 \oplus \Gamma_2 \vdash E \blacktriangleright_{e_{\Theta}}^{\tau_A} E'$ and and $\Delta \vdash A \rhd_{\tau} \tau_A$ we know that $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash_{\tau} E' : A\langle D \rangle$.
- Using of the syntactic equivalence on context projections (cag_fst) we can conclude

$$\Delta_! \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter} \{B^*\}_{[\tau_A]} \epsilon_{\Theta} E\{S(\mathbf{fst}\,e')\} \equiv_{\beta\eta} E\{\{\mathbf{fst}\,(\mathbf{openiter} \{(D \times B_1)\{B\}^*\}_{[\tau_A]} \in_{\Theta} S(e'))\} : B^*\tau_A\}$$

From Lemma D.2 (properties of iteration, part 5) we know that

$$\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{fst} \ (\mathbf{openiter} \{ (D \times B_1) \{ B \}^* \} [\tau_A] \in_{\partial} S(\epsilon')) \equiv_{\beta\eta}$$

$$\mathbf{openiter} \{ D \{ B \}^* \} [\tau_A] \in_{\partial} S(\mathbf{fst} \ \epsilon') : D \{ B \}^* \tau_A$$

Using Lemma D.19 (congruence of iterated contexts) on $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash_{\tau} E' : A\langle D \rangle$ and $\Delta \vdash A \rhd_{\tau} \tau_A$ we can conclude

$$\Delta; \Gamma_1 \uplus \Gamma_2 \vdash E \{ \text{fst (openiter} \{ (D \times B_1) \{ B \}^* \}^* [\tau_A] \in_\Theta S(e')) \} \equiv_{\beta\eta}$$
$$E \{ \text{openiter} \{ D \{ B \}^* \} [\tau_A] \in_\Theta S(\text{fst e'}) \} : B^* \tau_A$$

Putting these facts all together with transitivity (eq_trans), we have the desired result

$$\Delta; \Gamma_1 \uplus \Gamma_2 \vdash \mathbf{openiter} \{B^*\} [\tau_A] \ e_{\Theta} \ E_{\mathbf{f}} \{\mathbf{fst} \ e'\}\} \equiv \beta_\eta$$

$$E'_{\mathbf{f}} \{\mathbf{openiter} \{D_{\mathbf{f}} \{B^*\} [\tau_A] \ e_{\Theta} \ S(\mathbf{fst} \ e')\} : B^*\tau_A$$

Cases The case for at_snd is symmetric to at_fst.

Theorem D.23 (Dynamic Correctness). *If* \varnothing : $\Psi \vdash M : A$ *and* \varnothing ; $\varnothing \vdash M \rhd_{\tau} e$ *and* \varnothing ; $\varnothing \vdash V \rhd_{\tau} e'$ *and* $\varnothing \vdash A \rhd_{\tau} \tau_A \text{ and } \varnothing \vdash \Psi \rhd_{\tau} \Gamma \text{ and }$

1.
$$if \Psi \vdash M \hookrightarrow V : A \Leftrightarrow \varnothing; \Gamma \vdash e \equiv_{\beta\eta} e' : \tau_A$$
.

2.
$$if \Psi \vdash M \uparrow V : A \Leftrightarrow \varnothing; \Gamma \vdash e \equiv_{\beta\eta} e' : \tau_A$$
.

Proof. The backward direction follows from the forward direction and from the fact that evaluation in the structure of $\Psi \vdash M \hookrightarrow V : A$ and $\Psi \vdash M \uparrow V : A$. The cases for $\Psi \vdash M \uparrow V : A$ are uncomplicated. For SDP calculus is deterministic and total [24]. The forward direction follows by mutal induction over the

Cas

$$\begin{split} \Psi \vdash M_1 \hookrightarrow \lambda x : A_2.M_1' : A_2 \to A_1 \\ \Psi \vdash M_2 \hookrightarrow V_2 : A_2 \\ \Psi \vdash M_1' \{V_2/x\} \hookrightarrow V : A_1 \\ \Psi \vdash M_1M_2 \hookrightarrow V : A_1 \end{split} \quad \text{ev-app}$$

- By inversion on $\varnothing; \Psi \vdash M_1M_2 : A_1$ we can conclude $\varnothing; \Psi \vdash M_1 : A_3 \to A_1$ and $\varnothing; \Psi \vdash M_2 : A_3$.
- know that $\varnothing : \Psi \vdash \lambda x : A_2.M_1' : A_3 \to A_1$. By inversion we have that $\varnothing : \Psi \uplus \{x : A_2\} \vdash M_1' : A_1$ By type preservation[24] on $\varnothing : \Psi \vdash M_1 : A_3 \to A_1$ and $\Psi \vdash M_1 \to \lambda x : A_2 \cdot M'_1 : A_2 \to A_1$ we and that $A_3 = A_2$.
 - From inversion on \varnothing ; $\varnothing \vdash M_1M_2 \rhd_{\tau} e$ we have that $e = e_1e_2$ where \varnothing ; $\varnothing \vdash M_1 \rhd_{\tau} e_1$ and $\varnothing; \varnothing \vdash M_2 \rhd_\tau e_2.$
- $\varnothing \vdash A_2 \rhd_\tau \tau_A'$. $\varnothing : \varnothing \vdash M_1' \rhd_\tau e_1''$. Using Lemma C.11 (type encoding total and decidable) we can $\varnothing \vdash A_2 \rhd_\tau \tau_1$ and $\varnothing \vdash A_1 \rhd_\tau \tau_2$. From Lemma C.13 (uniqueness of type encoding) can conclude construct $\varnothing \vdash A_2 \to A_1 \rhd_{\tau} \tau'_A$. By inversion we can conclude that $\tau'_A = \tau_1 \to \tau_2$ where By Lemma D.25 (term encoding is total and decidable) we have \varnothing ; $\varnothing \vdash V_2 \rhd_\tau e_2'$ and $\varnothing;\varnothing\vdash\lambda x:A_2.M_1'\rhd_\tau e_1'$. By inversion we can conclude that $e_1'=\lambda x:\tau_A'.e_1'$ where

Using the induction hypothesis on $\varnothing : \Psi \vdash M_1 : A_2 \to A_1$ and $\varnothing : \varnothing \vdash M_1 \rhd_\tau e_1$ and $\varnothing; \varnothing \vdash \lambda x : A_2.M_1' \rhd_{\tau} e_1' \text{ and } \varnothing \vdash A_2 \to A_1 \rhd_{\tau} \tau_1 \to \tau_2 \text{ and } \varnothing \vdash \Psi \rhd_{\tau} \Gamma \text{ and}$ $\Psi \vdash M_1 \hookrightarrow \lambda x : A_2 . M_1' : A_2 \to A_1$ we have that $\varnothing : \Gamma \vdash e_1 \equiv_{\beta \eta} e_1' : \tau_1 \to \tau_2$. Similarly, applying the induction hypothesis to \varnothing ; $\Psi \vdash M_2 : A_2$ and \varnothing ; $\varnothing \vdash M_2 \rhd_\tau e_2$ and \varnothing ; $\varnothing \vdash V_2 \rhd_\tau e_2'$ and $\varnothing \vdash A_2 \rhd_\tau \tau_1$ and $\varnothing \vdash \Psi \rhd_\tau \Gamma$ we have a derivation that $\varnothing; \Gamma \vdash e_2 \equiv_{\beta\eta} e_2' : \tau_1$.

By type preservation [24] on \varnothing ; $\Psi \vdash M_2 : A_2$ and $\Psi \vdash M_2 \hookrightarrow V_2 : A_2$ we know that

 $\varnothing; \Psi \vdash V_2 : A2$. By substitution on $\varnothing; \Psi \vdash V_2 : A_2$ and $\varnothing; \Psi \uplus \{x : A_2\} \vdash M_1' : A_1$ we have that \varnothing ; $\Psi \vdash M'_1\{V_2/x\} : A_1$.

By Lemma D.25 (term encoding is total and decidable) we have \varnothing ; $\varnothing \vdash M'_1\{V_2/x\} \rhd_\tau e''$.

judgments $\varnothing \colon \Psi \vdash M_1'\{V_2/x\} : A_1$ and $\varnothing \colon \varnothing \vdash V \rhd_\tau e'$ and $\varnothing \vdash A_1 \rhd_\tau \tau_A$ and $\varnothing \vdash \Psi \rhd_\tau \Gamma$ and From appealing to the induction hypothesis on $\varnothing; \varnothing \vdash M'_1\{V_2/x\} \rhd_\tau e''$, with the auxiliary $\Psi \vdash M'_1\{V_2/x\} \hookrightarrow V : A_1$, we can conclude that $\varnothing ; \Gamma \vdash e'' \equiv_{\beta\eta} e' : \tau_A$.

Lemma D.24 (substition for encoding regular term variables) on $\varnothing; \varnothing \vdash V_2 \rhd_\tau e_2'$ and $\varnothing; \varnothing \vdash M_1' \rhd_{\tau} e_1''. \varnothing; \varnothing \vdash M_1'\{V_2/x\} \rhd_{\tau} e''.$ tells us that $e'' = e_1''\{e_2'/x\}.$

By β -equivalence on term congruence (eq_abs_beta) we have that

 \varnothing ; $\Gamma \vdash e'_1 e'_2 \equiv_{\beta\eta} e' : \tau_A$. Using transitivity (eq_trans) and congruence on application (eq_app) on \varnothing ; $\Gamma \vdash (\lambda x : \tau_1 \cdot e_1'')e_2' \equiv \beta_{\eta} e' : \tau_A$. Given that $e_1' = \lambda x : \tau_1 \cdot e_1''$ this is the same as $\varnothing; \Gamma \vdash e_1 \equiv_{\beta\eta} e_1' : \tau_1 \to \tau_2 \text{ and } \varnothing; \Gamma \vdash e_2 \equiv_{\beta\eta} e_2' : \tau_1 \text{ we have the desired result}$

 \varnothing ; $\Gamma \vdash e_1 e_2 \equiv_{\beta\eta} e' : \tau_A$.

$\Psi \vdash M_1 \hookrightarrow \mathbf{box}\, M_1' : \square A_1 \quad \Psi \vdash M_2\{M_1'/x\} \hookrightarrow V : A_2 \text{ ev-letb}$ $\Psi \vdash \mathbf{let} \ \mathbf{box} \ x : A_1 = M_1 \ \mathbf{in} \ M_2 \hookrightarrow V : A_2$

By inversion on \varnothing ; $\Psi \vdash \mathbf{let}$ box $x : A_1 = M_1$ in $M_2 : A_2$ we know that \varnothing ; $\Psi \vdash M_1 : \square A_1$ and

By inversion on \varnothing ; $\varnothing \vdash \mathbf{let}$ box $x : A_1 = M_1$ in $M_2 \rhd_{\tau} e$ we have that $e = (\lambda x : \tau_1 \cdot e_2)e_1$ and that $\varnothing \vdash \Box A_1 \rhd_{\tau} \tau_1 \text{ and } \varnothing; \varnothing \vdash M_1 \rhd_{\tau} e_1 \text{ and } \varnothing; \{x\} \vdash M_2 \rhd_{\tau} e_2.$ $\{x: A_1\}; \Psi \vdash M_2: A_2.$

- By Lemma D.25 (term encoding is total and decidable) we have $\varnothing : \varnothing \vdash \mathbf{box} M_1' \rhd_{\tau} e_1'$. By inversion we know that $e'_1 = \Lambda \alpha : \star \to \star \cdot e''_1$ and $\{\alpha : \star \to \star\}; \beta \vdash M'_1 \rhd_{\alpha \tau} e''_1$.

- Therefore, by induction on the derivation $\varnothing; \varnothing \vdash M_1 \rhd_\tau e_1$, with the auxiliary judgments $\varnothing; \Psi \vdash M_1 : \Box A_1$ and $\varnothing; \varnothing \vdash \mathbf{box} M_1' \rhd_\tau \Lambda \alpha : \star \to \star e_1''$ and $\varnothing \vdash \Box A_1 \rhd_\tau \tau_1$ and $\varnothing \vdash \Psi \rhd_\tau \Gamma$ and $\Psi \vdash M_1 \hookrightarrow \mathbf{box} M_1' : \square A_1$, we can conclude $\varnothing ; \Gamma \vdash e_1 \equiv_{\beta\eta} \Lambda\alpha : \star \to \star . e_1'' : \tau_1$.
- $\{\alpha: \star \to \star\}; \beta \vdash M_1' \rhd_{\alpha\tau} e_1'' \text{ we can conclude } \emptyset; \beta \vdash M_2\{M_1'/x\} \rhd_\tau e_2\{\Lambda\alpha: \star \to \star e_1''/x\}. \text{ Which }$ Using Lemma D.27 (substitution for the encoding of modal variables) on \varnothing ; $\{x\} \vdash M_2 \rhd_\tau e_2$ and we know by the above is just $\varnothing : \varnothing \vdash M_2\{M_1'/x\} \rhd_\tau e_2\{e_1'/x\}$.
 - $\varnothing; \Psi \vdash \mathbf{box} M_1' : \Box A_1$. By inversion on $\varnothing; \Psi \vdash \mathbf{box} M_1' : \Box A_1$ we have that $\varnothing; \varnothing \vdash M_1' : A_1$. By type preservation[24] on \varnothing ; $\Psi \vdash M_1 : \Box A_1$ and $\Psi \vdash M_1 \hookrightarrow \mathbf{box}\, M_1' : \Box A_1$ we know that Therefore, by substitution on $\{x:A_1\}$; $\Psi \vdash M_2:A_2$ we know that \varnothing ; $\Psi \vdash M_2\{M'_1/x\}:A_2$.
- By the induction hypothesis on \varnothing ; $\varnothing \vdash M_2\{M_1'/x\} \rhd_\tau e_2\{e_1'/x\}$, with the auxiliary judgments $\varnothing , \Psi \vdash M_2\{M_1'/x\} : A_2 \text{ and } \varnothing ; \varnothing \vdash V \rhd_{\tau} e' \text{ and } \varnothing \vdash \Psi \rhd_{\tau} \Gamma \text{ and } \varnothing \vdash A_2 \rhd_{\tau} \tau_A \text{ and }$
 - $\Psi \vdash M_2\{M_1'/x\} \hookrightarrow V : A_2$, we have that $\varnothing : \Gamma \vdash e_2\{e_1'/x\} \equiv \beta_\eta e' : \tau_A$.
 - \varnothing ; $\Gamma \vdash e_2\{e_1'/x\} \equiv_{\beta\eta} e' : \tau_A$ we have the desired \varnothing ; $\Gamma \vdash (\lambda x : \tau_1.e_2)e_1 \equiv_{\beta\eta} e' : \tau_A$. Finally by β -equivalence and transitivity (eq_abs_beta and eq_trans) on

Case

$$\begin{split} \Psi \vdash M &\hookrightarrow \mathbf{box}\, M' : \Box B \\ & \varnothing \vdash M' \uparrow V' : B \\ \Psi \vdash \langle A', \varnothing, \Theta \rangle (V') &\hookrightarrow V : A' \langle B \rangle \\ \overline{\Psi} \vdash \text{iter} \, [\Box B, A'] [\Theta] \,\, M &\hookrightarrow V : A' \langle B \rangle \end{split} \quad \text{ev_it}$$

55

- By inversion on \varnothing ; $\Psi \vdash \mathbf{iter} \square B$, $A' [\Theta] M : A$ we know that $A = A' \langle B \rangle$ and \varnothing ; $\Psi \vdash M : \square B$ and \varnothing ; $\Psi \vdash \Theta : A'\langle \Sigma \rangle$.
- By inversion on \varnothing ; $\varnothing \vdash \text{iter} [\Box B, A'][\Theta] M \triangleright_{\tau} e$ we know that $e = \text{iter} \{B^*\}[\tau][\tau_A'] e_{\Theta} e_M$ and $\varnothing \vdash A' \rhd_{\tau} \tau'_{A}$ and $\varnothing; \varnothing \vdash \Theta \rhd_{\tau}^{\tau'_{A}} e_{\Theta}$ and $\varnothing; \varnothing \vdash M \rhd_{\tau} e_{M}$.

- By Lemma D.25 (term encoding is total and decidable) we can construct $\varnothing;\varnothing\vdash V'\rhd_{\tau'_A}e'_v$ and By the rule for empty elimination substitutions (sub_empty) we have $\varnothing;\varnothing;\Theta;e_{\Theta} \triangleright_{\tau}^{T_A}$ [}. From By the property of evaluaton results[24] on $\varnothing \vdash M' \uparrow V' : B$ we can conclude $\varnothing \vdash V' \uparrow B$. $\varnothing; \varnothing \vdash \langle A', \varnothing, \Theta \rangle(V') \rhd_{\tau} e_{l}.$
- $\varnothing; \varnothing; \Theta; e_{\Theta} \triangleright_{\tau^A}^{\tau_A} \{\}$ we can constuct $\varnothing; \varnothing \vdash \langle A', \varnothing, \Theta \rangle (V') \triangleright_{\tau^A}^{\tau_A}$ openiter $\{B^*\}[\tau_A'] e_{\Theta} \{\}(e_v')$ by the rule for encoding eliminations (en_elim).

 $\varnothing \vdash V' \Uparrow B \text{ and } \varnothing \vdash A' \rhd_\tau \tau'_A \text{ and } \varnothing; \varnothing \vdash \Theta \rhd_\tau^{\tau_A} e_\Theta \text{ and } \varnothing; \varnothing \vdash V' \rhd_{\tau_A'} e'_v \text{ and }$

- $\varnothing; \varnothing \vdash \langle A', \varnothing, \Theta \rangle (V') \blacktriangleright_{\tau^A}^{\tau_A}$ openiter $\{B^*\}[\tau_A'] \in_{\Theta} \{ \}(e_v') \text{ and } \varnothing; \varnothing \vdash \langle A', \varnothing, \Theta \rangle (V') \rhd_{\tau} e_l \text{ and } \varnothing \vdash \varnothing \vdash_{\sigma} \varnothing \vdash_{\sigma} \text{ openiter} \{B^*\}[\tau_A'] \in_{\Theta} \{ \}(e_v') \equiv_{\beta\eta} e_l : \tau_A'.$ Futhermore, by the definition of substitution we know $\varnothing; \varnothing \vdash \mathbf{openiter} [B^*][\tau'_A] e_{\Theta} =_{\beta\eta} e_l : \tau'_A$. Using Lemma D.10 (dynamic correctness of elimination) on $\langle A', \varnothing, \Theta \rangle(V')$ and
- By Lemma D.25 (term encoding is total and decidable) we have $\varnothing;\varnothing\vdash\mathbf{box}M'\rhd_{\tau}e'_{M}$. By inversion on $\varnothing : \varnothing \vdash \mathbf{box} M' \rhd_{\tau} e'_{M}$ we have that $e'_{M} = \Lambda \alpha : \star \to \star \cdot e''_{M}$ and
- $\{\alpha : \star \to \star\}; \varnothing \vdash M' \rhd_{\alpha\tau} e''_{M}.$

Using Lemma C.11 (type encoding total and decidable) we can construct $\varnothing \vdash \Box B \rhd_{\tau} \tau_{B}$ and

- By application of the induction hypothesis to the derivation $\varnothing;\varnothing \vdash M \rhd_\tau e_M$, with the auxiliary judgments \varnothing ; $\Psi \vdash M : \Box B$ and \varnothing ; $\varnothing \vdash \mathbf{box} M' \rhd_{\tau} \Lambda \alpha : \star \to \star e''_{M}$ and $\varnothing \vdash \Box B \rhd_{\tau} \tau_{B}$ and $\varnothing \vdash \Psi \rhd_{\tau} \Gamma$ and $\Psi \vdash M \hookrightarrow \mathbf{box} M' : \Box B$, we can conclude that $\varnothing; \Gamma \vdash e_M \equiv_{\beta\eta} \Lambda\alpha : \star \to \star : e_M'' : \tau_B.$ and $\varnothing \vdash B \rhd_{\tau'_A} \tau'_B$.
- Because τ_A' was encoded in a empty context, by Lemma C.7 (well-formedness of encoding) we
- know that $\varnothing \vdash \tau_A' : \star$. Then, using Lemma D.26 (world substitution for terms) on $\varnothing \vdash \tau_A' : \star$ and
- - By type preservation[24] on $\Psi \vdash M \hookrightarrow \mathbf{box} \ M' : \Box B$ and $\varnothing ; \Psi \vdash M : \Box B$ we know that $\{\alpha: \star \to \star\}; \varnothing \vdash M' \rhd_{\alpha\tau} e_M'' \text{ we know from that } \varnothing; \varnothing \vdash M' \rhd_{\tau_A'} e_M' \{\lambda\beta: \star \tau_A'/\alpha\}.$
 - $\varnothing; \Psi \vdash \mathbf{box} M' : \Box B$. By inversion on $\varnothing; \Psi \vdash \mathbf{box} M' : \Box B$. we have that $\varnothing; \varnothing \vdash M' : B$.

- By application of the induction hypothesis to $\varnothing : \varnothing \vdash M' \rhd_{\tau'_A} e''_M \{\lambda \beta : \star \cdot \tau'_A/\alpha \}$, with the auxiliary judgments and $\varnothing : \varnothing \vdash M' : B$ and $\varnothing : \varnothing \vdash V' \rhd_{\tau'_A} e'_v$ and $\varnothing \vdash B \rhd_{\tau'_A} \tau'_B$ and $\varnothing \vdash \Psi \rhd_{\tau} \Gamma$ and $\varnothing \vdash M' : R$, we can conclude that $\varnothing : \varnothing \vdash e''_M \{\lambda \beta : \star \cdot \tau'_A/\alpha \} \equiv_{\beta \eta} e'_v : \tau'_B$.
- Using Lemma D.4 (replacements are well-formed dynamic replacements) on $\varnothing; \Psi \vdash \Theta : A'\langle \Sigma \rangle$ we have that \varnothing ; $\Psi \vdash \Theta : A'(\varnothing; \Sigma)$. Using this encoding along with $\varnothing \vdash V' \uparrow B$ and Lemma D.5 (elimination typing) we can conclude \varnothing ; $\Psi \vdash \langle A', \varnothing, \Theta \rangle(V') : A'\langle B \rangle$.
- $\varnothing : \varnothing \vdash \langle A', \varnothing, \Theta \rangle(V') \rhd_{\tau} e_{\ell}$ and $\varnothing : \varnothing \vdash V \rhd_{\tau} e'$ and $\varnothing \vdash A'\langle B \rangle \rhd_{\tau} \tau_{A}$ and $\varnothing \vdash \Psi \rhd_{\tau} \Gamma$ and Appealing to the induction hypothesis on $\varnothing; \Psi \vdash \langle A', \varnothing, \Theta \rangle(V') : A' \langle B \rangle$ and $\Psi \vdash \langle A', \varnothing, \Theta \rangle(V') \hookrightarrow V : A' \langle B \rangle$ we can conclude that $\varnothing : \varnothing \vdash e_l \equiv_{\beta\eta} e' : \tau_A$.
- application congruence (eq.app). By $\varnothing; \varnothing \vdash \mathbf{openiter} \{B^*\}[\tau_A'] \in \Theta e'_{\nu} \equiv \beta_{\eta} e' : \tau_A$ we can use transtivity (eq.trans) to conclude $\varnothing; \Gamma \vdash \mathbf{openiter} \{B^*\}[\tau_A'] \in \Theta (e_M[\lambda \beta : \star, \tau_A']) \equiv \beta_{\eta} e' : \tau_A$. And weakening, and congruence on type application (eq.tapp) we have that $\varnothing; \Gamma \vdash e_M[\lambda\beta : \star, \tau_A'] \equiv \beta_\eta \ e_v' : \tau_B'$. This equivalence allows us to conclude $\varnothing; \Gamma \vdash \mathbf{openiter}\{B^\star\}[\tau_A'] \in \Theta(M[\lambda\beta : \star, \tau_A']) \equiv \beta_\eta \ \mathbf{openiter}\{B^\star\}[\tau_A'] \in \Theta(M[\lambda\beta : \star, \tau_A']) \equiv \beta_\eta \ \mathbf{openiter}\{B^\star\}[\tau_A'] \in \Theta(M[\lambda\beta : \star, \tau_A']) \equiv \beta_\eta \ \mathbf{openiter}\{B^\star\}[\tau_A'] \in \Theta(M[\lambda\beta : \star, \tau_A']) = \beta_\eta \ \mathbf{openiter}\{B^\star\}[\tau_A'] \in \Theta(M[\lambda\beta : \star, \tau_A']) = \beta_\eta \ \mathbf{openiter}\{B^\star\}[\tau_A'] \in \Theta(M[\lambda\beta : \star, \tau_A']) = \beta_\eta \ \mathbf{openiter}\{B^\star\}[\tau_A'] \in \Theta(M[\lambda\beta : \star, \tau_A']) = \beta_\eta \ \mathbf{openiter}\{B^\star\}[\tau_A'] = \Theta(M[\lambda\beta : \star, \tau_A']) = \beta_\eta \ \mathbf{openiter}\{B^\star\}[\tau_A'] = \Theta(M[\lambda\beta : \star, \tau_A']) = \beta_\eta \ \mathbf{openiter}\{B^\star\}[\tau_A'] = \Theta(M[\lambda\beta : \star, \tau_A']) = \beta_\eta \ \mathbf{openiter}\{B^\star\}[\tau_A'] = \Theta(M[\lambda\beta : \star, \tau_A']) = \theta(M[\lambda\beta : \star, \tau$ $\varnothing;\varnothing \vdash (\Lambda\alpha:\star\to\star:e''_M)[\lambda\beta:\star.\tau'_A] \equiv_{\beta\eta} e'_{\upsilon}:\tau'_B \text{ and by }\varnothing;\Gamma \vdash e_M \equiv_{\beta\eta} \Lambda\alpha:\star\to\star:e''_M:\tau_B,$ By β -equivalence (eq_tabs_beta) on \varnothing ; $\varnothing \vdash e''_M \{\lambda\beta : \star . \tau'_A/\alpha\} \equiv_{\beta\eta} e'_v : \tau'_B$ we have finally by rolling up the definition of iter, we have the desired \varnothing ; $\Gamma \vdash \mathbf{iter} \{B^*\}[\tau][\tau_A'] e_\Theta \ e_M \equiv_{\beta\eta} e' : \tau_A$.

Ĭ.

Cases The remaining cases follow by straightforward application of of the induction hypothesis and congruence rules. Lemma D.24 (Substitution for encoding of regular term variables). If $\Delta; \Xi \vdash M_1 \rhd_{\tau} e_1$ and $\Delta; \Xi \vdash M_2 \rhd_{\tau} e_2 \text{ and } \Delta; \Xi \vdash M_2\{M_1/x\} \rhd_{\tau} e \text{ where } x \notin \Xi \text{ then } e = e_2\{e_1/x\}.$

Proof. By straightforward induction over the structure of $\Delta; \Xi \vdash M_2 \rhd_{\tau} e_2$.

Lemma D.25 (Replacement and term encoding are total and decidable).

- 1. If Ω ; $\Upsilon \vdash M : A \text{ and } \Delta \vdash \tau : \star \text{ we can construct } \Delta$; $dom(\Omega) \vdash M \rhd_{\tau} e$.
- 2. If Ω ; $\Upsilon \vdash \Theta : A\langle \Sigma \rangle$ and $\Delta \vdash \tau : \star$ we can construct Δ ; dom $(\Omega) \vdash \Theta \rhd_{\tau}^{\tau_A} e_{\Theta}$.

Proof. By mutual induction over the structure of Ω ; $\Upsilon \vdash M : A$ and Ω ; $\Upsilon \vdash \Theta : A\langle \Sigma \rangle$, and use of Lemma

Lemma D.26 (World substitution for term encoding). If $\Delta \uplus \{\alpha : \star \to \star\}; \Xi \vdash M \rhd_{\alpha \tau'} e$ then C.11 (type encoding is total and decidable).

 $\Delta; \Xi \vdash M \rhd_{\tau} e \{ \lambda \beta : \star \tau / \alpha \}.$

Proof. Follows by straightforward induction over the structure of $\Delta \uplus \{\alpha : \star \to \star\}; \Xi \vdash M \rhd_{\alpha \tau'} e$ and

Lemma C.15 (world substitution for type encoding).

Lemma D.27 (Substitution of for encoding modal variables). If $\Delta \vdash \Upsilon \rhd_{\tau} \Gamma_1$ and $\Delta \vdash \Omega \rhd \Gamma_2$ and

 $\Delta \vdash A_1 \rhd_\tau \tau_{A_1} \ and \ \Omega \uplus \{x : A_2\}; \Upsilon \vdash M_1 : A_1 \ and \ \Delta; \operatorname{dom}(\Omega) \uplus \{x\} \vdash M_1 \rhd_\tau e_1 \ and \ \Omega; \Upsilon \vdash M_2 : A_2 \ and \ \Delta \uplus \{\alpha : \star \to \star\}; \operatorname{dom}(\Omega) \vdash M_2 \rhd_{\alpha\tau'} e_2 \ then \ \Delta; \operatorname{dom}(\Omega) \vdash M_1\{M_2/x\} \rhd_\tau e_1' \ where$

 $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e'_1 \equiv_{\beta\eta} e_1 \{ \Lambda\alpha : \star \to \star \cdot e_2/x \} : \tau_{A_1}.$

Proof. By induction over the structure of Δ ; dom $(\Omega) \uplus \{x\} \vdash M_1 \rhd_{\tau} e_1$.

$$\Delta; \operatorname{dom}(\Omega) \uplus \{x\} \vdash x \rhd_{\tau} x[\lambda\beta : \star, \tau]$$
 en_bvar

 $x \in \text{dom}(\Omega) \uplus \{x\}$

- $\Delta \in \{\alpha : \star \to \star\}; \operatorname{dom}(\Omega) \vdash M_2 \rhd_{\alpha\tau'} e_2 \text{ we have that } \Delta; \operatorname{dom}(\Omega) \vdash M_2 \rhd_{\tau} e_2\{\lambda\beta : \star .\tau/\alpha\}, \text{ which } \Delta \in \{\alpha : \star \to \star\}; \operatorname{dom}(\Omega) \vdash M_2 \rhd_{\tau} e_2\{\lambda\beta : \star .\tau/\alpha\}, \text{ which } \Delta \in \{\alpha\} : \star .\tau/\alpha\}$ By using Lemma D.26 (world substitution for term encodings) on the derivation
- By modal type substitution on $\Omega \uplus \{x: A_2\}; \Upsilon \vdash x: A_1 \text{ and } \Omega; \Upsilon \vdash M_2: A_2 \text{ we can conclude}$ Ω ; $\Upsilon \vdash x\{M_2/x\} : A_1$.

means by the definition of substitution that Δ ; dom $(\Omega) \vdash x\{M_2/x\} \triangleright_{\tau} e_2\{\lambda\beta : \star .\tau/\alpha\}$

By using Theorem C.2 (static correctness, forward direction) on

 Δ ; dom $(\Omega) \vdash x\{M_2/x\} \triangleright_{\tau} e_2\{\lambda\beta : \star_{\tau}\tau/\alpha\}$; with the auxiliary judgements $\Delta \vdash \Gamma \triangleright_{\tau} \Gamma_1$ and $\Delta \vdash \Omega \rhd \Gamma_2$ and $\Delta \vdash A_1 \rhd_\tau \tau_{A_1}$ and $\Omega; \Upsilon \vdash x\{M_2/x\}: A_1$, we have that $\Delta; \Gamma_1 \uplus \Gamma_2 \vdash e_2\{\lambda\beta: \star.\tau/\alpha\}: \tau_{A_1}$.

 β -equivalence for type abstraction (eq tabs beta) applied to Δ ; $\Gamma \vdash e_2\{\lambda\beta : \star .\tau/\alpha\} : \tau_{A_1}$. Finally, The congruence $\Delta; \Gamma \vdash e_2\{\lambda\beta : \star \cdot \tau/\alpha\} \equiv_{\beta\eta} (\Lambda\alpha : \star \to \star \cdot e_2)[\lambda\beta : \star \cdot \tau] : \tau_{A_1}$ follows by by the definition of substitution, we know that

 $\Delta; \Gamma \vdash e_2\{\lambda\beta : \star .\tau/\alpha\} \equiv_{\beta\eta} (x[\lambda\beta : \star .\tau])\{\Lambda\alpha : \star \to \star .e_2/x\} : \tau_{A_1}.$

Cases The remaining cases follow from straightforward uses of the induction hypothesis and congruence rules. 5
